Week #5 Lab – Installing Ubuntu 24 OS and VirtualBox Hypervisor and creating a virtual machine

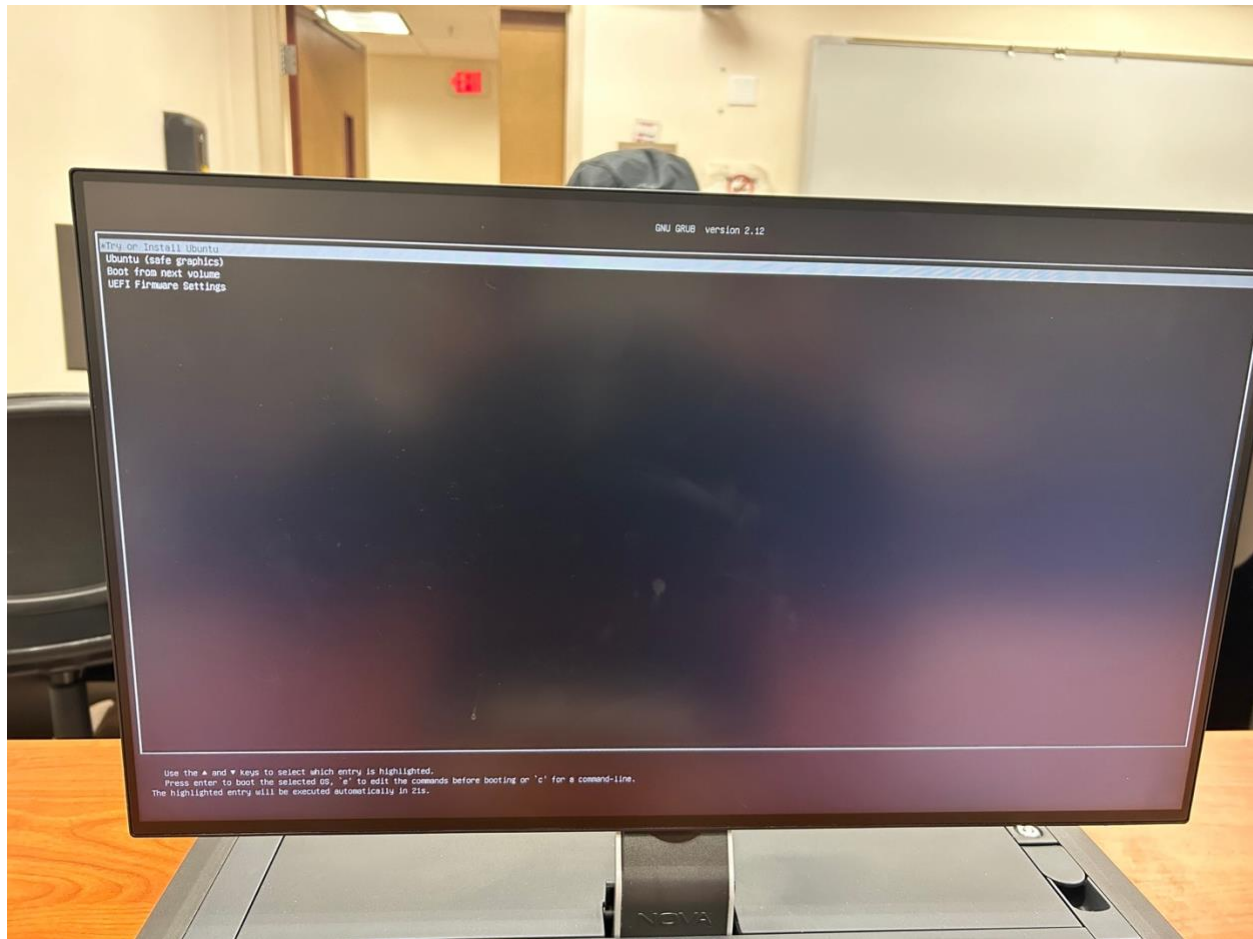

Installing a bootable for Ubuntu 24

- Downloading a bootable USB drive for Ubuntu 24 Linux Operating System.
- Once the bootable is finished downloading, restart the computer.
- Simultaneously click F12 until the boot screen appears.

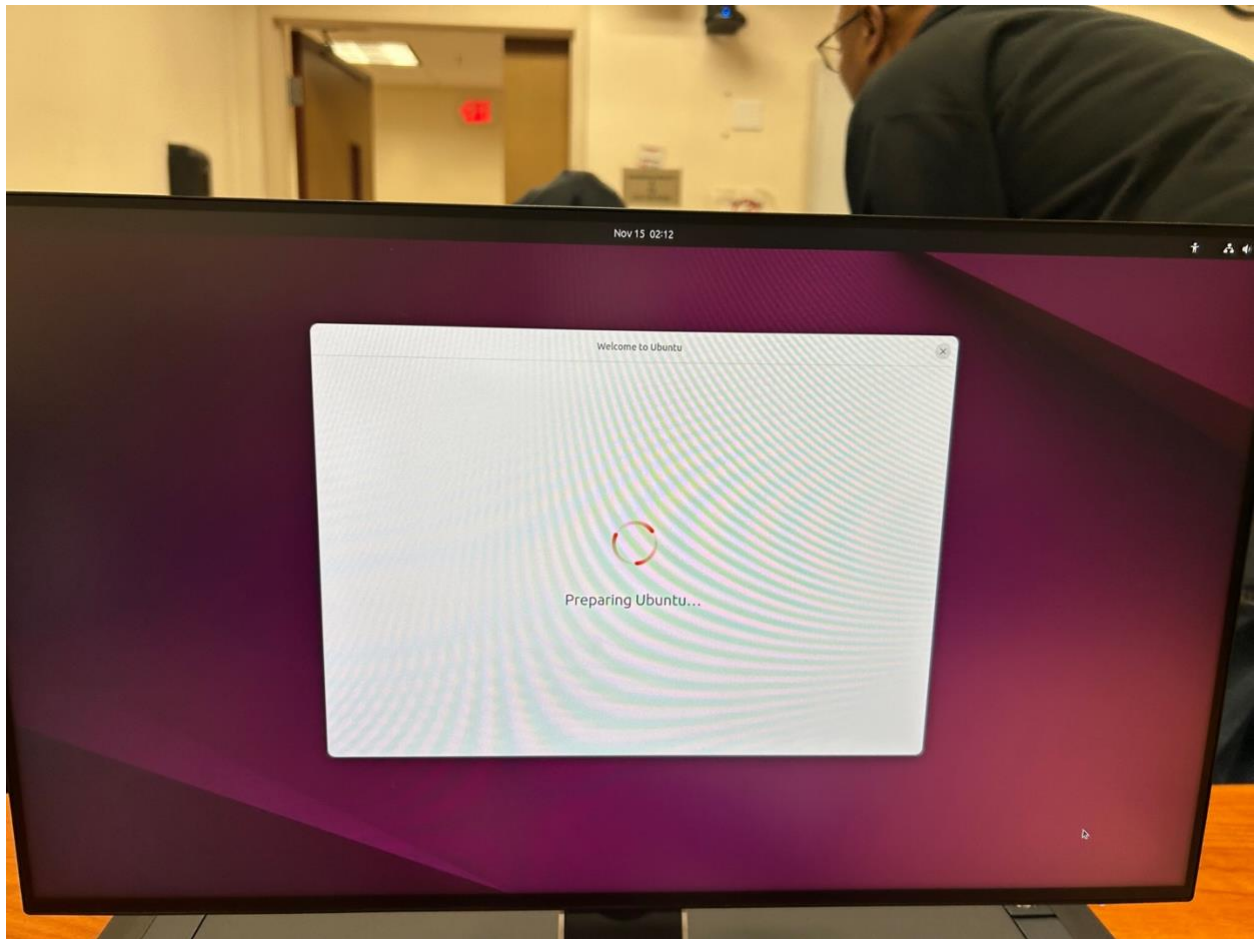

- Once at the boot screen, select the USB drive plugged into the computer. In this picture the USB is "*UEFI: VendorC ProductCode 3.00*".

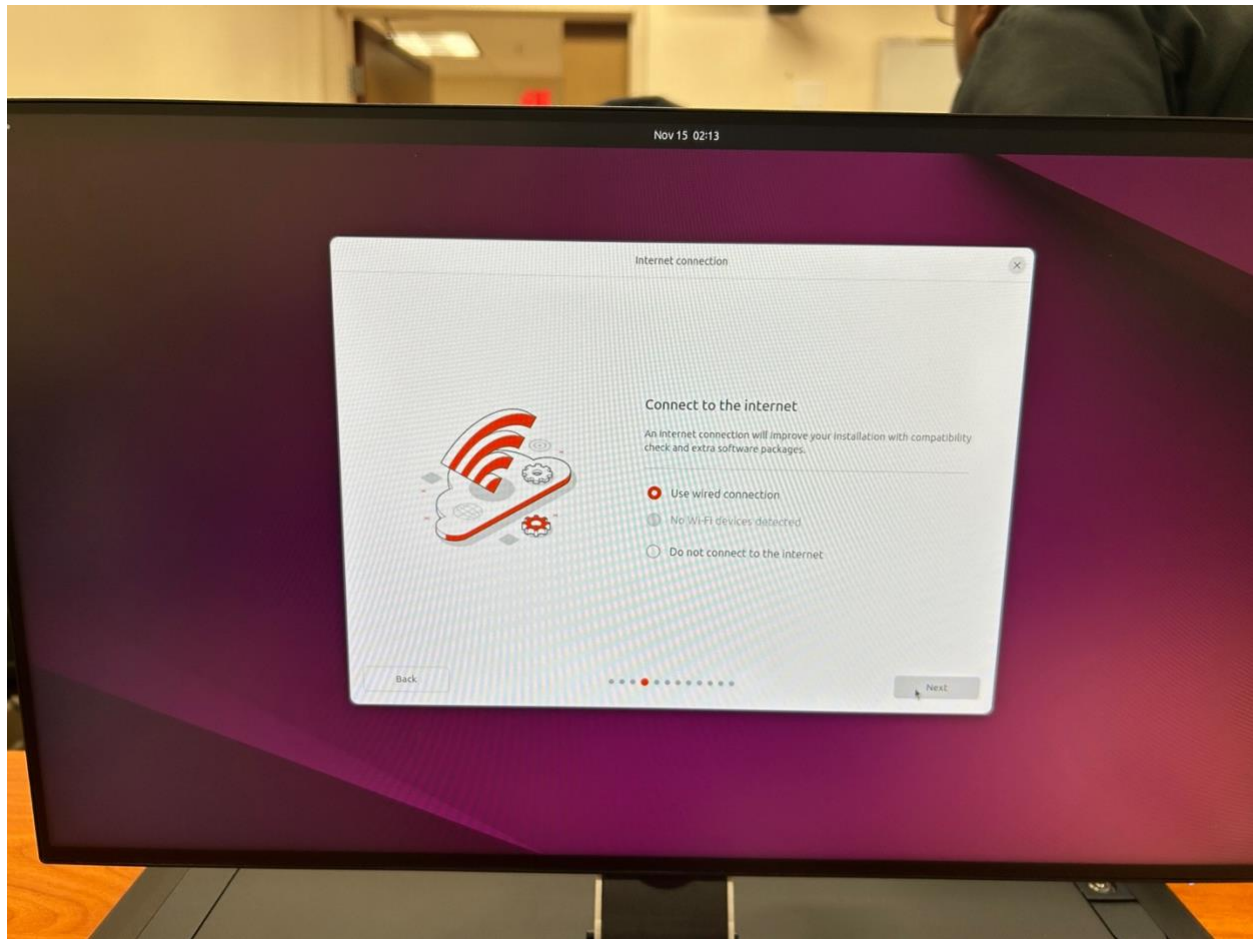

- The next screen available will be the boot loader program.
- Press the enter key on *“Try or Install Ubuntu”*.

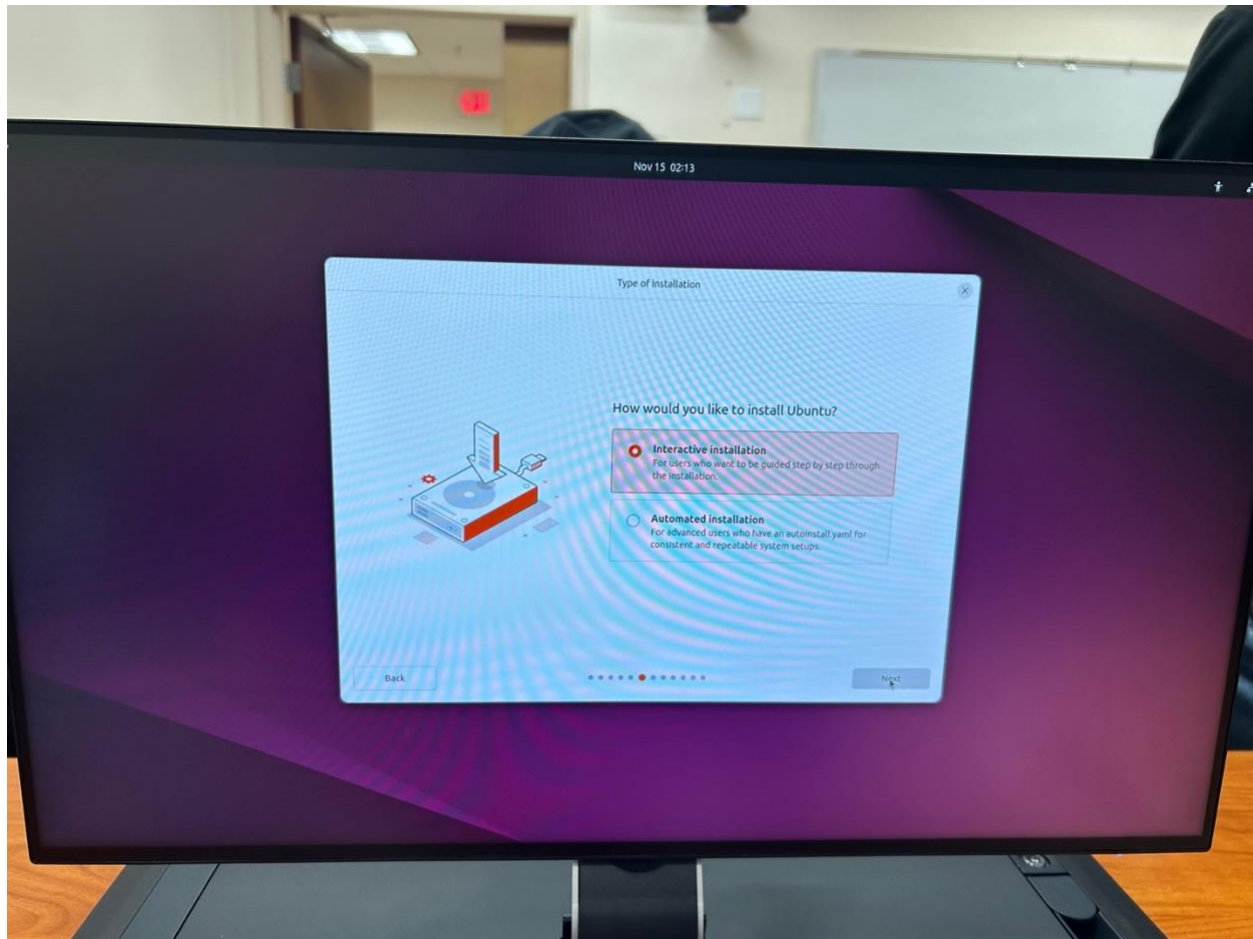

- After the USB is chosen, the computer will start booting Ubuntu 24 as shown in the image above.

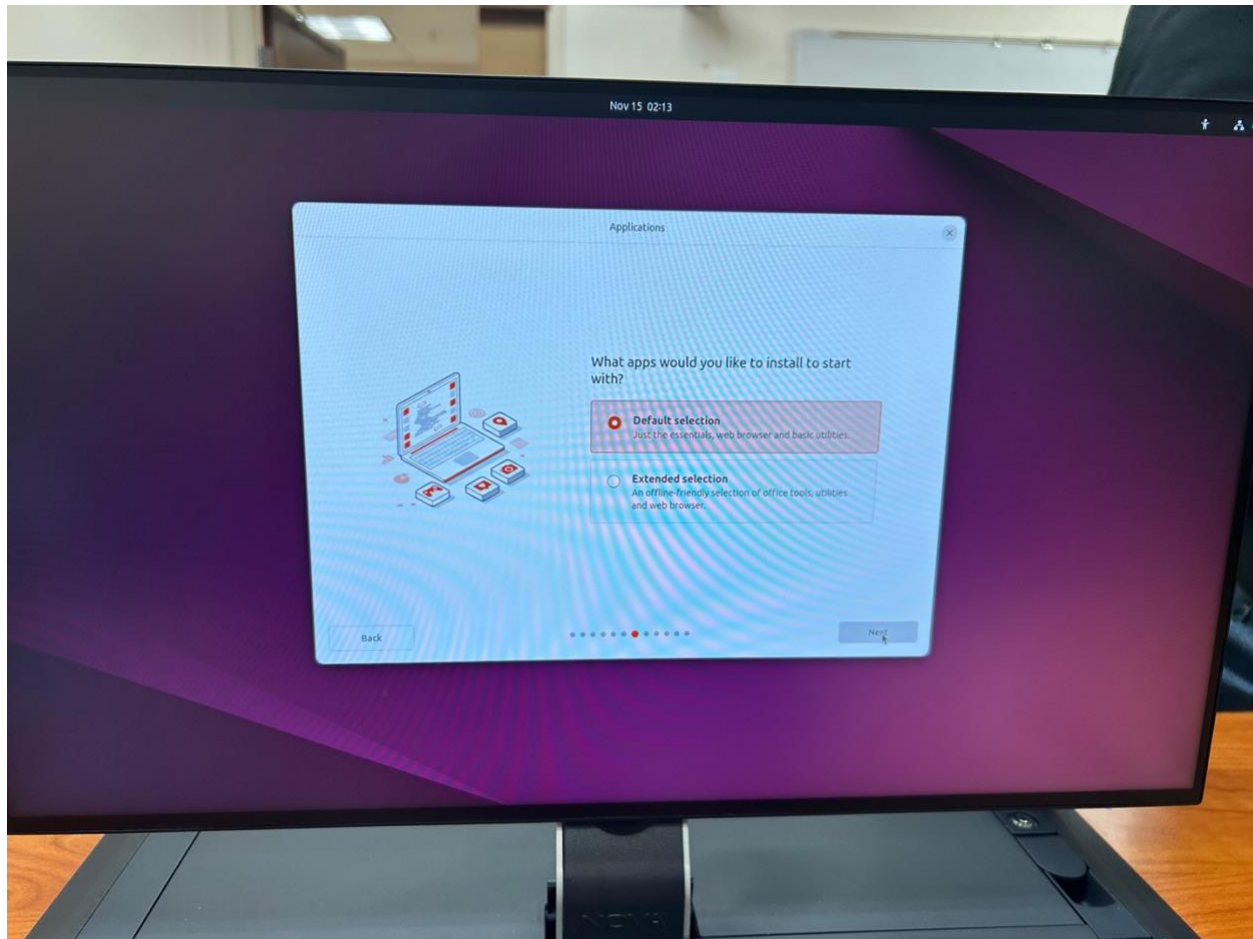

- Computer software preparing to install Ubuntu OS on the following screen.

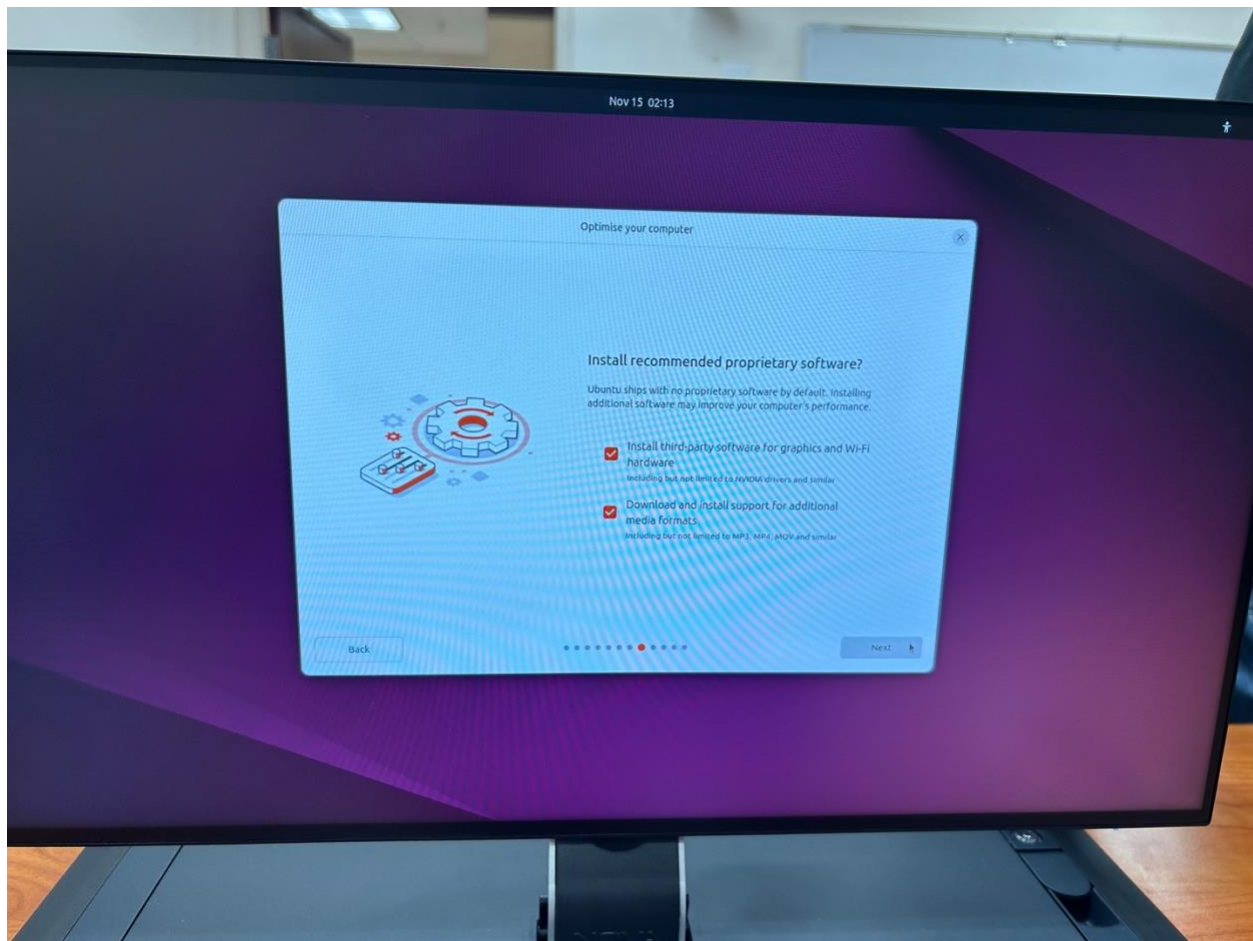

- Connect to the internet by selecting “*Use wired connection*”.

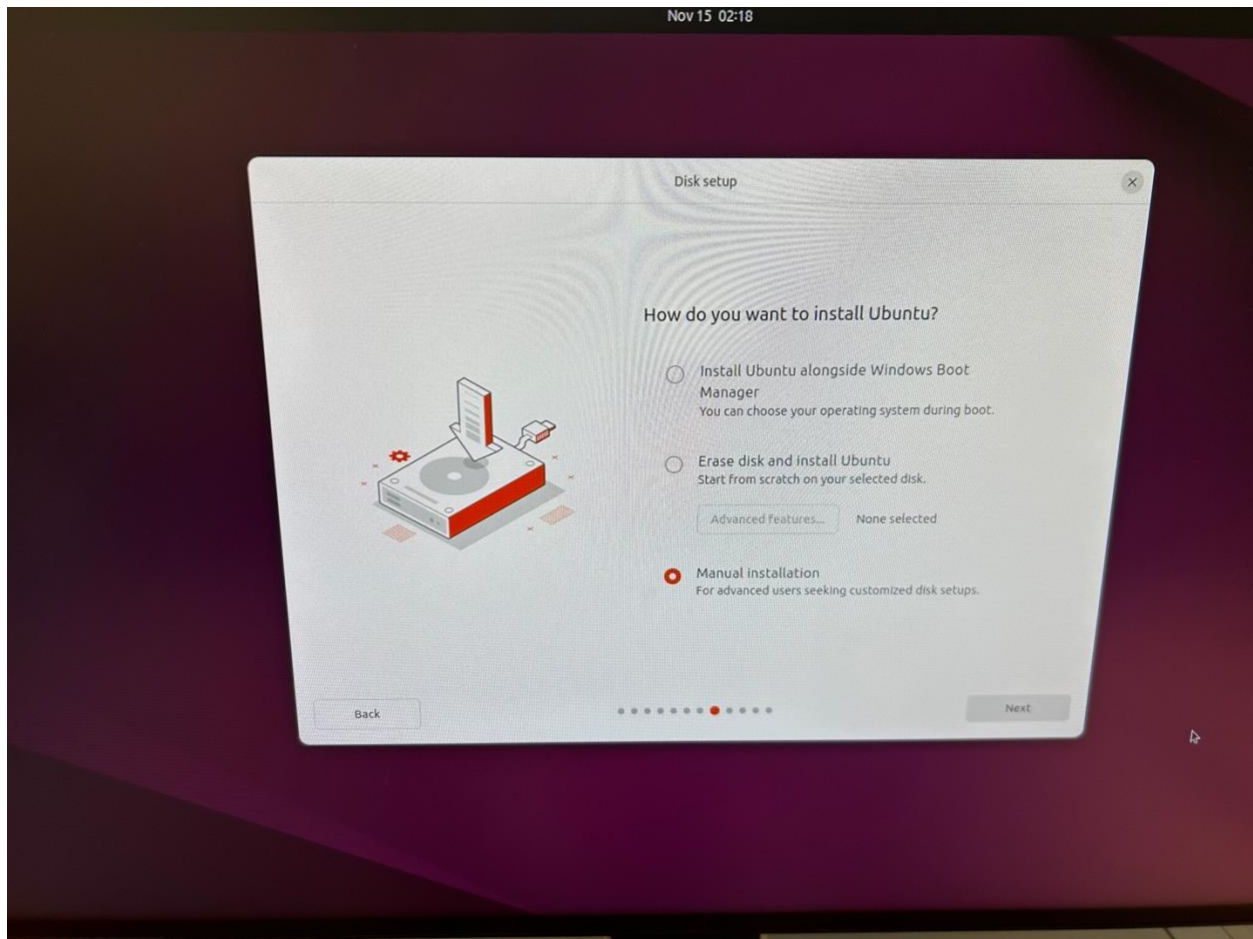

- Select “*Interactive installation*” option.

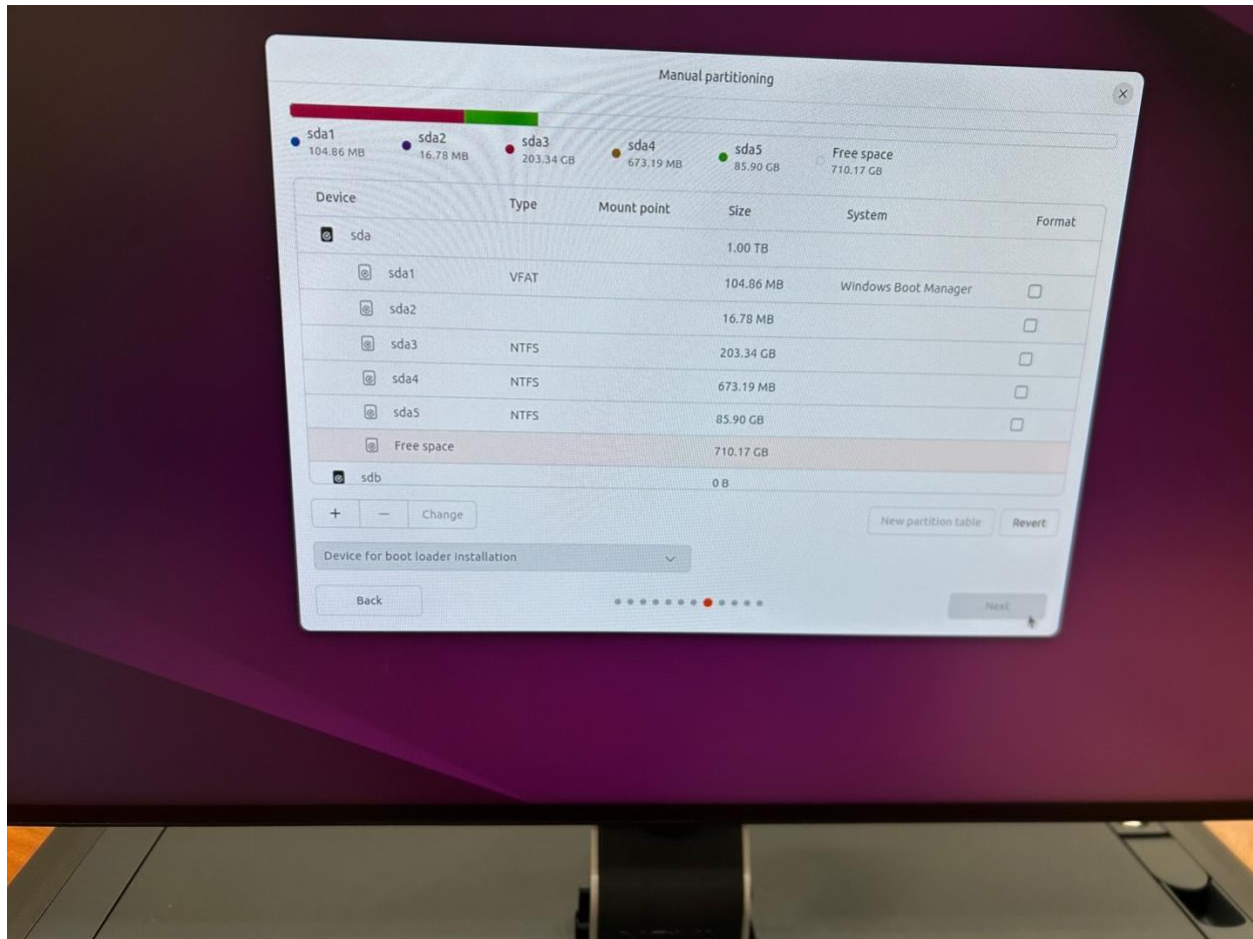

- Select the option "Default selection".

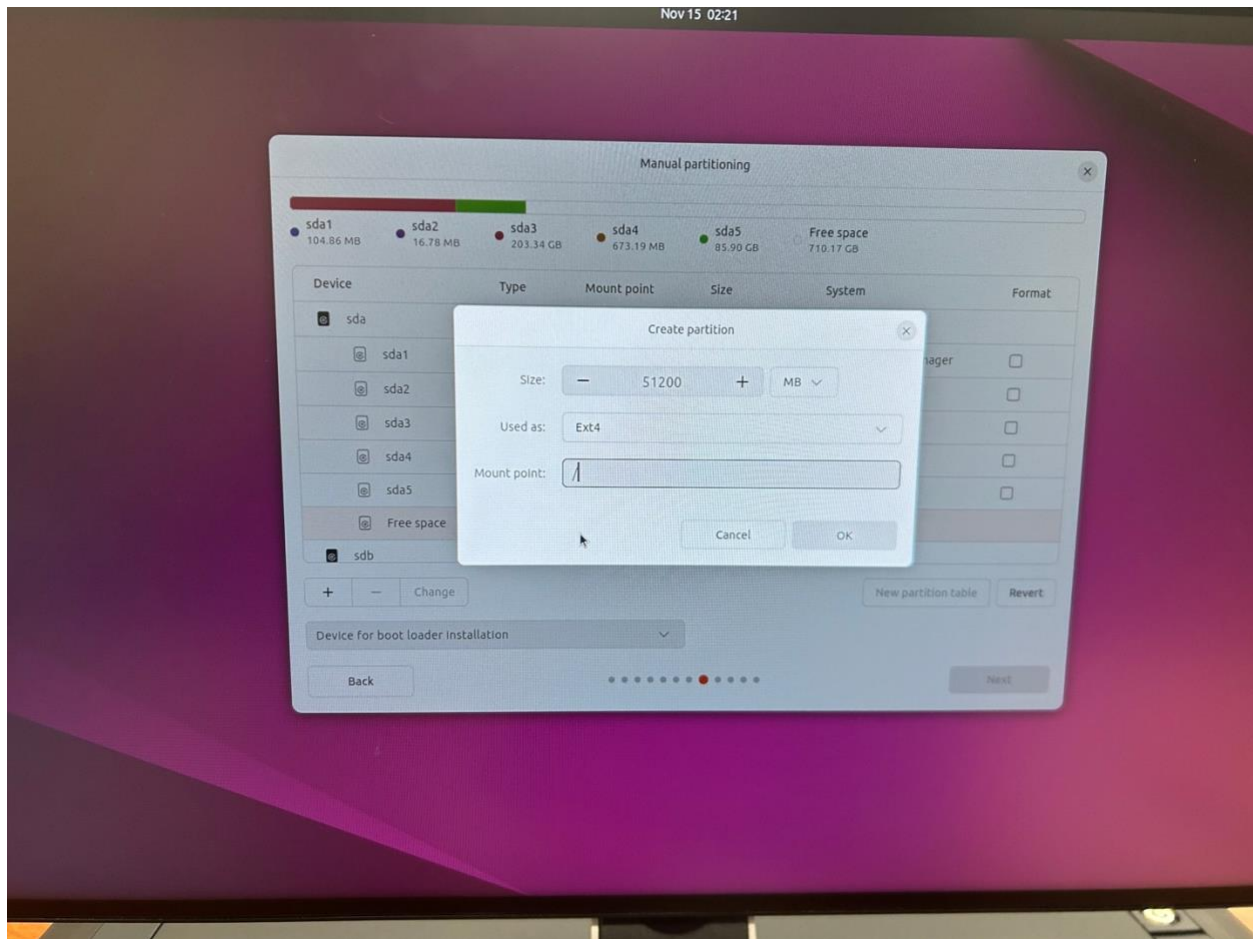

- Select both options for proprietary software to be installed with the OS.

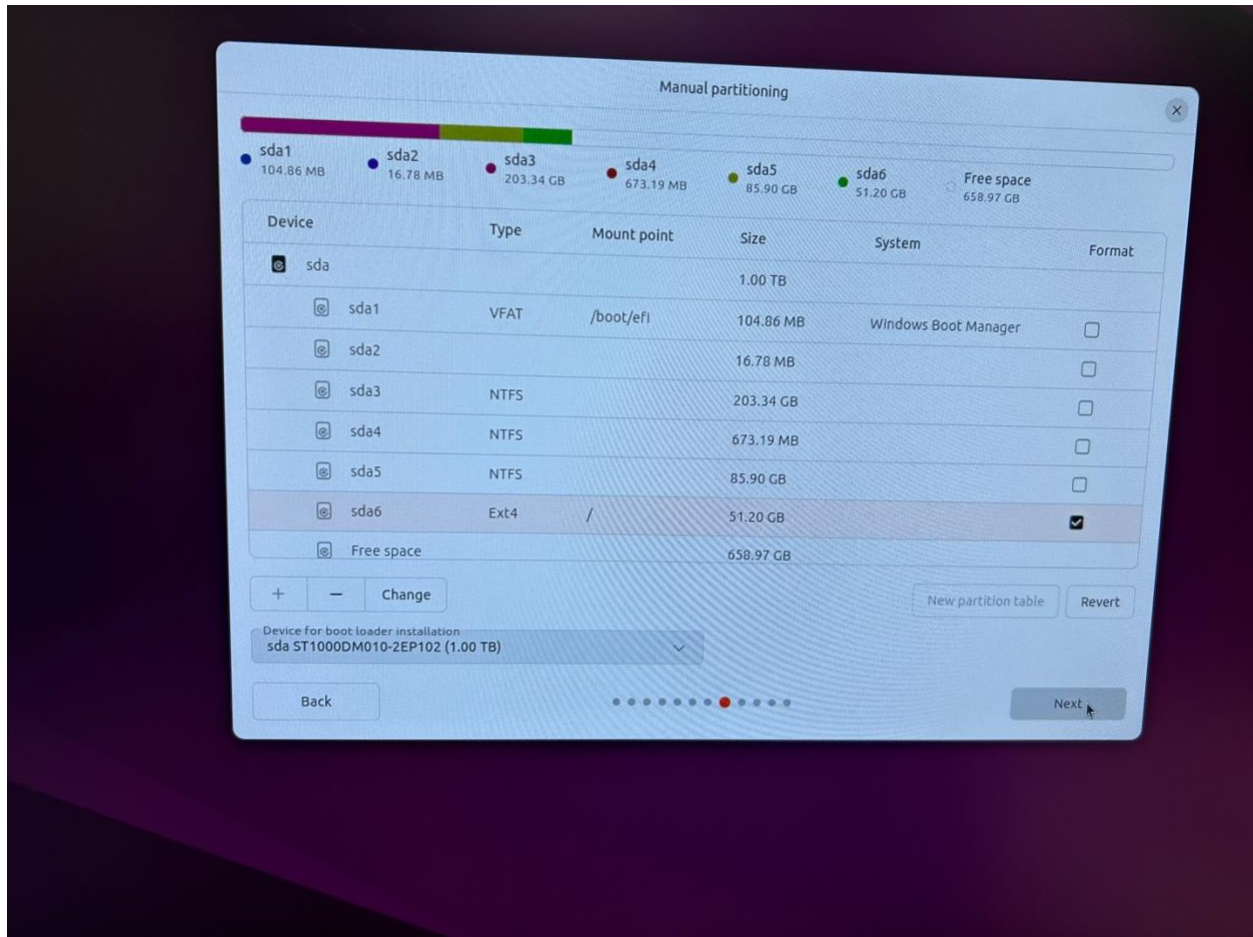

- Choose manual installation.

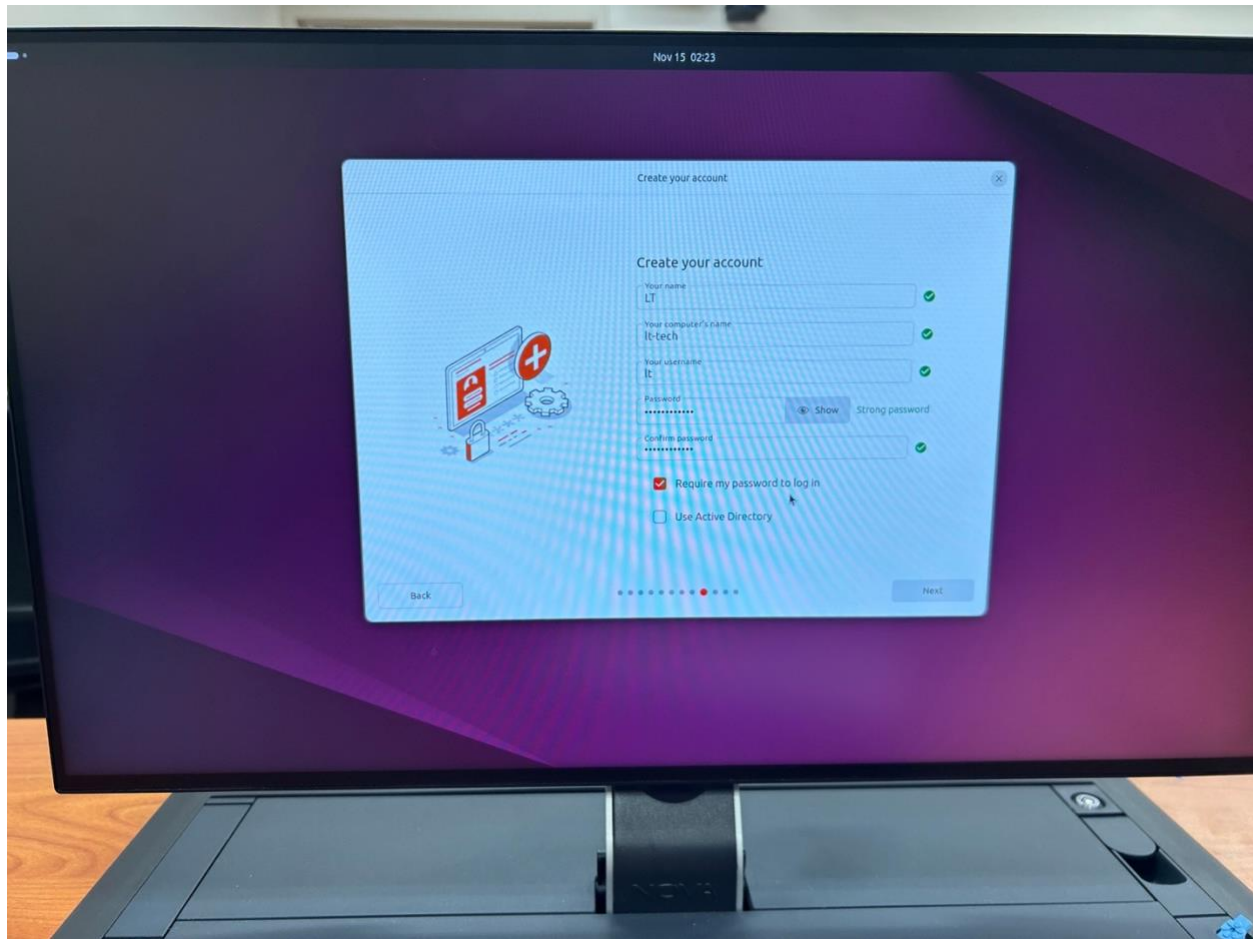

- The Manual partitioning table will appear on the next screen.
- Select the Hard Drive in the computer with 710.17 GB of space remaining.
- Click the + button to create a new partition for Ubuntu.

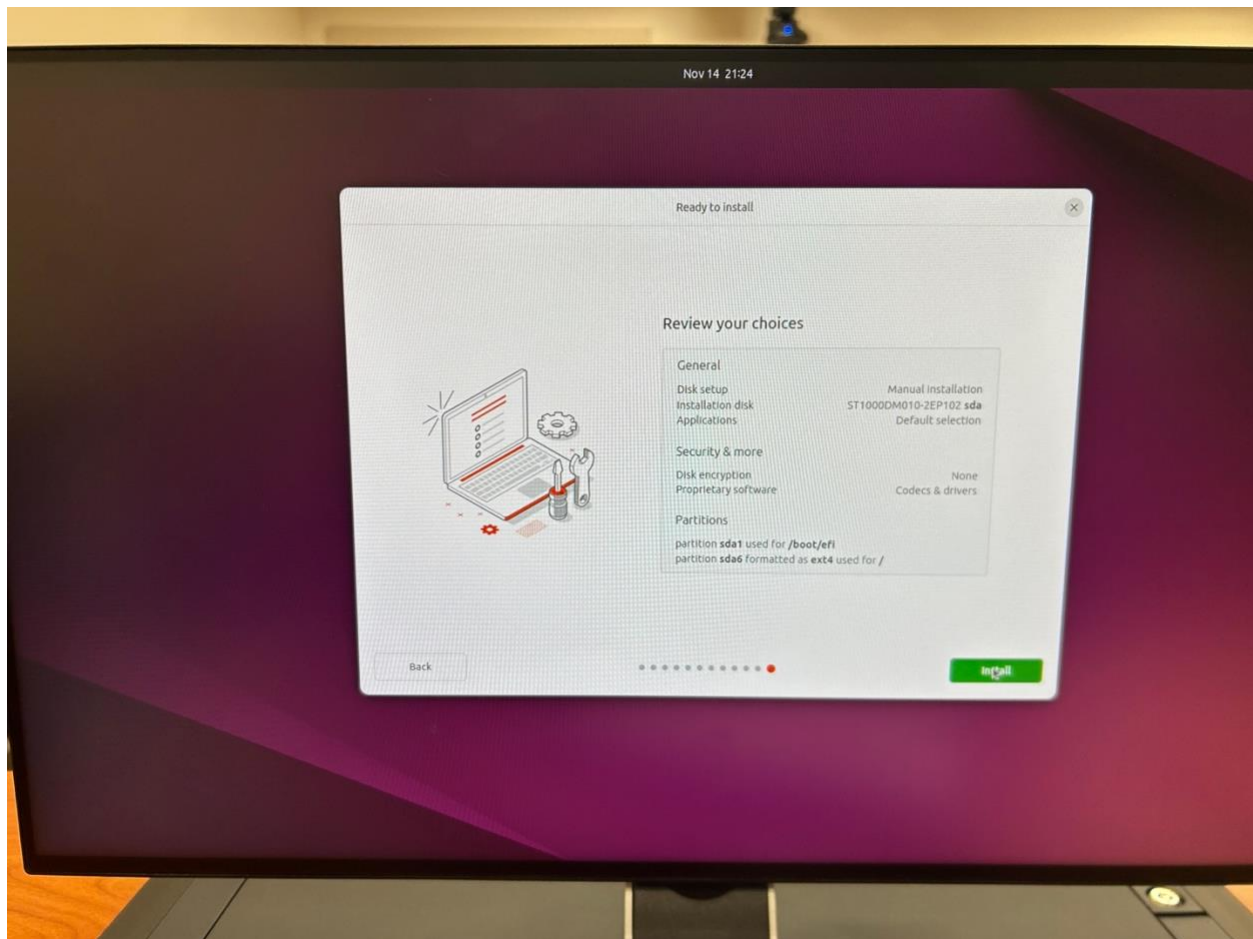

- Choose the amount of storage (in MB) to partition on the hard drive for Ubuntu 24 and a virtual machine.
- Select the Mount Point as “/”.
- Select ok

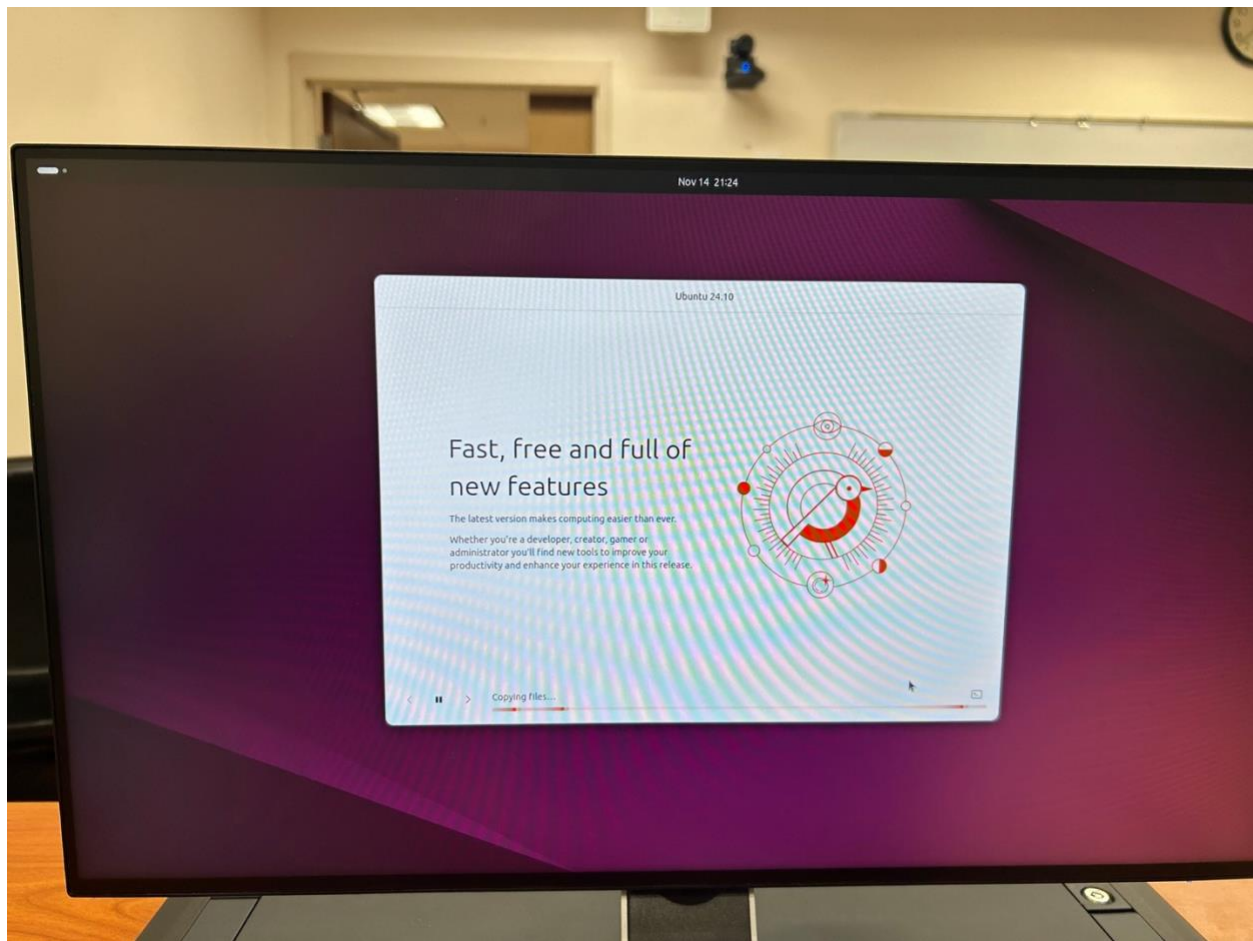

- Sda6 is the new partition created with 51.20 GB of storage.

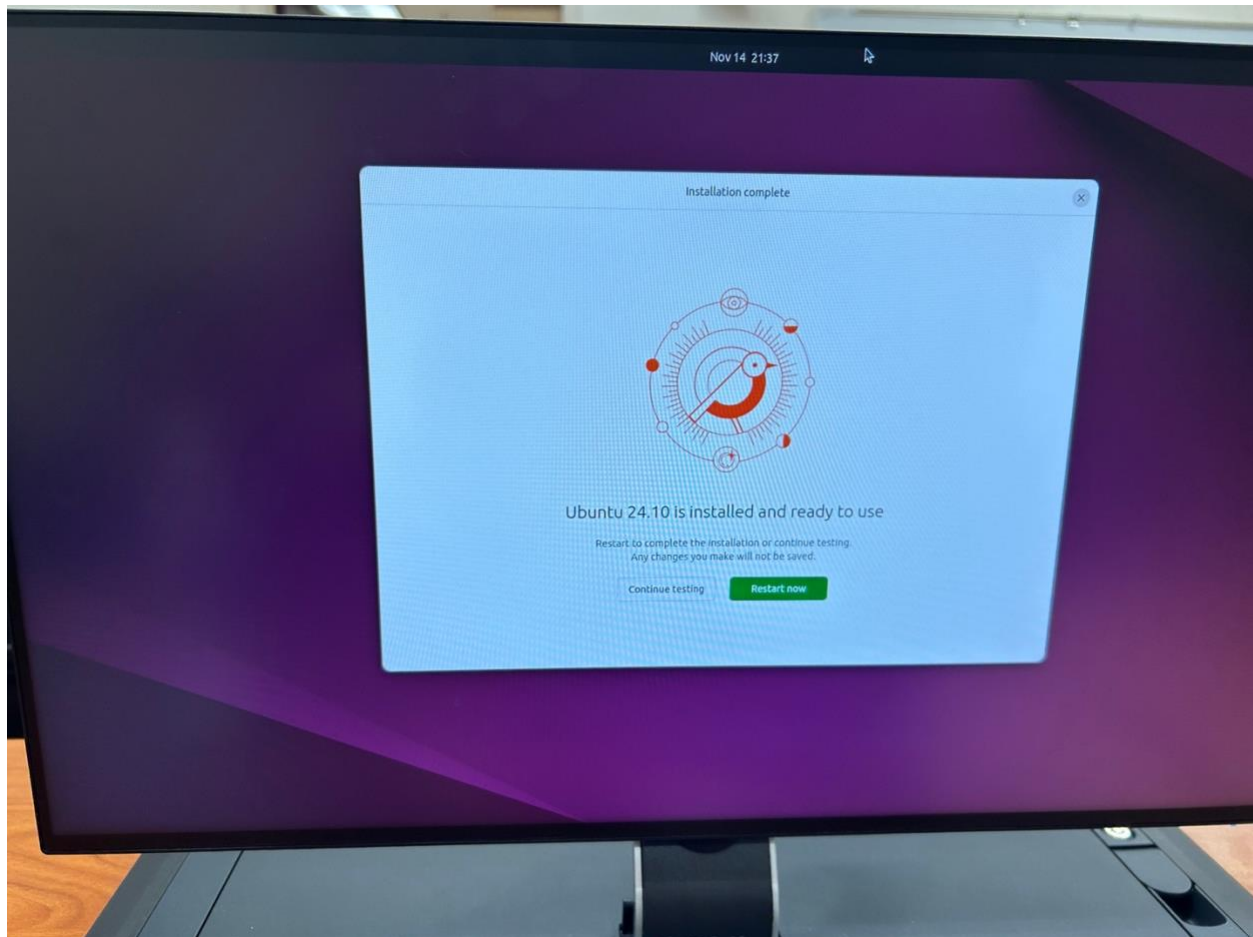

- Create an account.

- Review choices made and then click install.

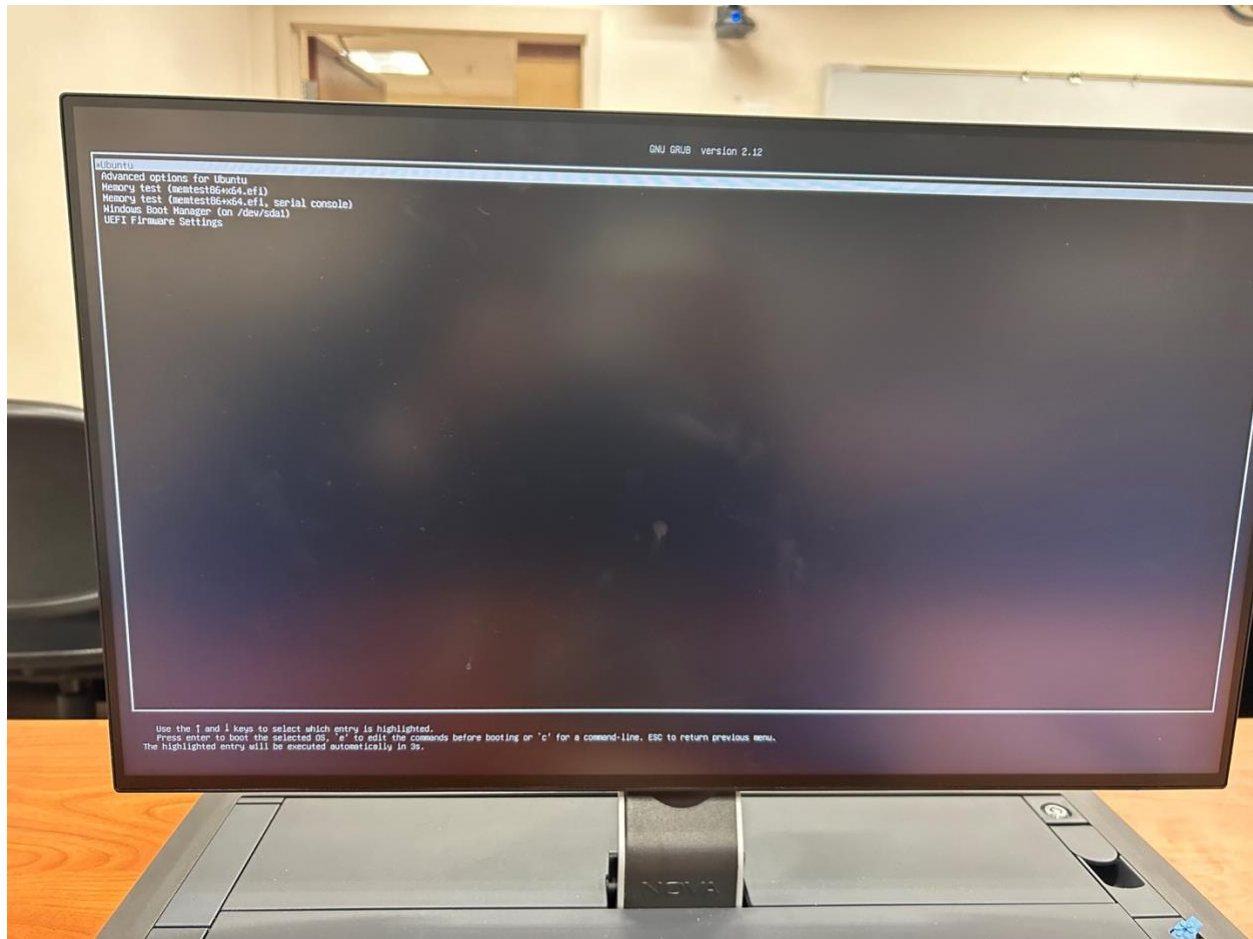

- Ubuntu 24.10 begins to install screen.

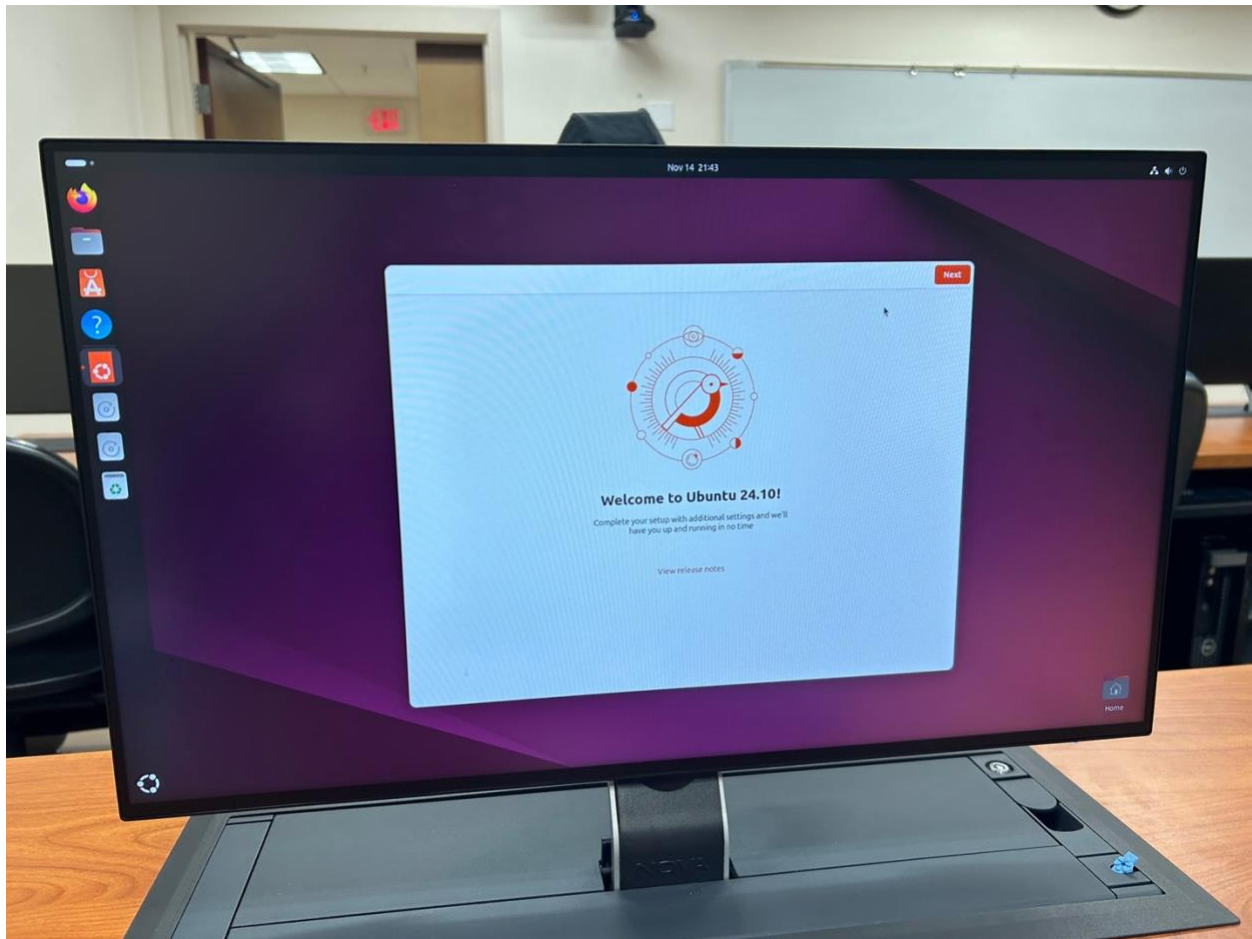

- Once Ubuntu is installed and ready to use, select the Restart now button.

- Ubuntu begins to start.

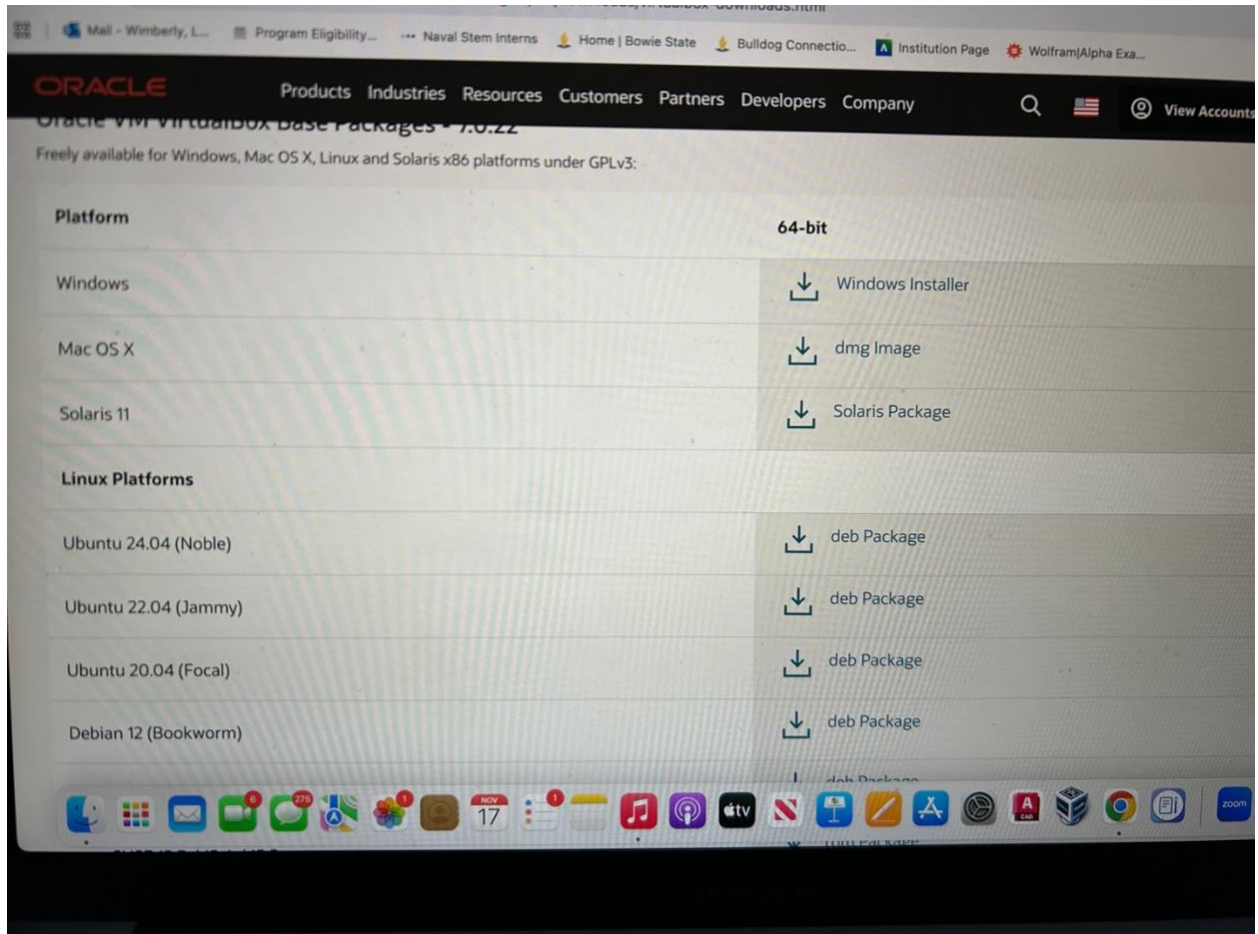

- Press the enter key on Ubuntu in the bootloader program.

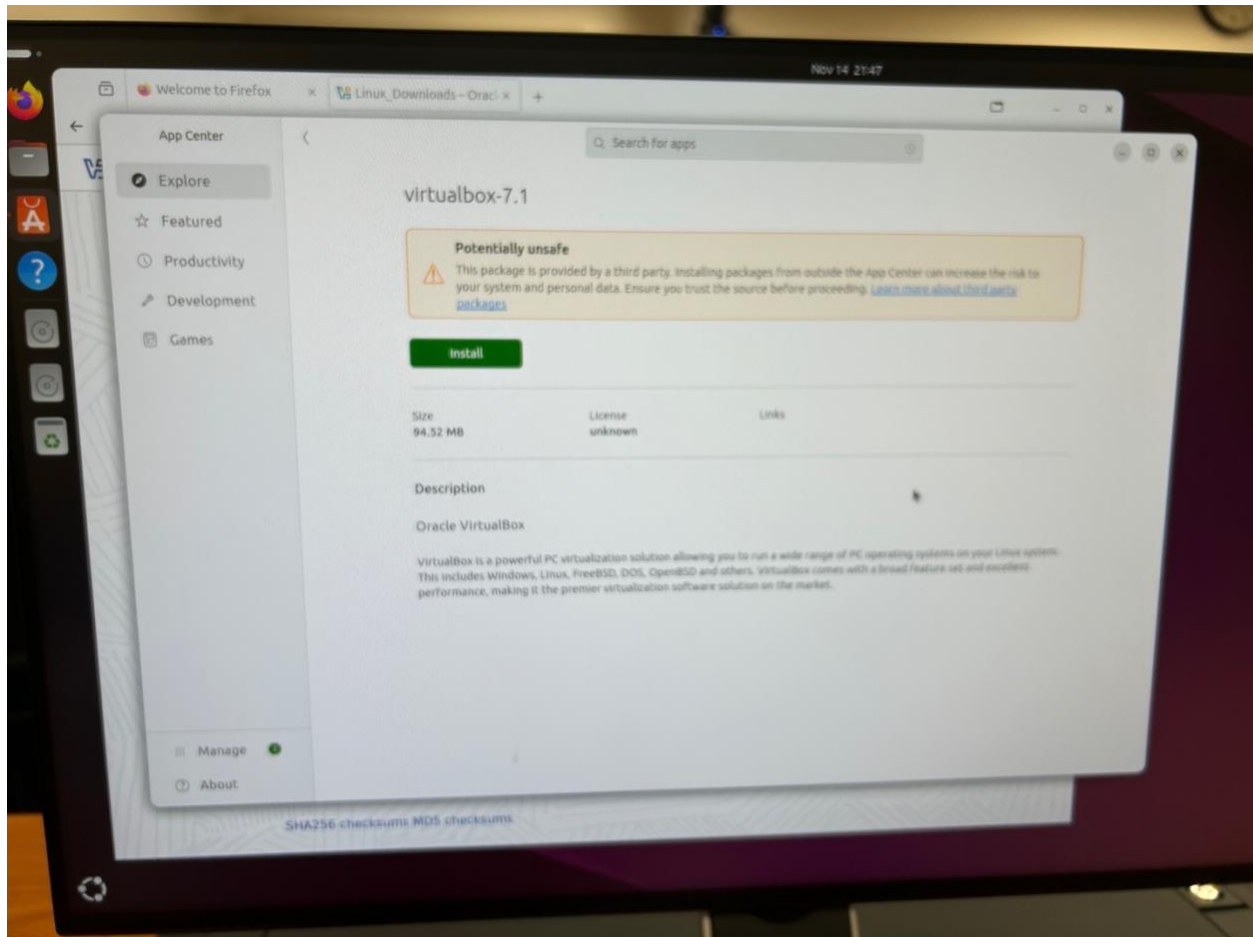

- Ubuntu is now ready to use.
- Open Firefox and search on the Oracle website for VirtualBox Hypervisor for Linux download.

Installing VirtualBox Hypervisor

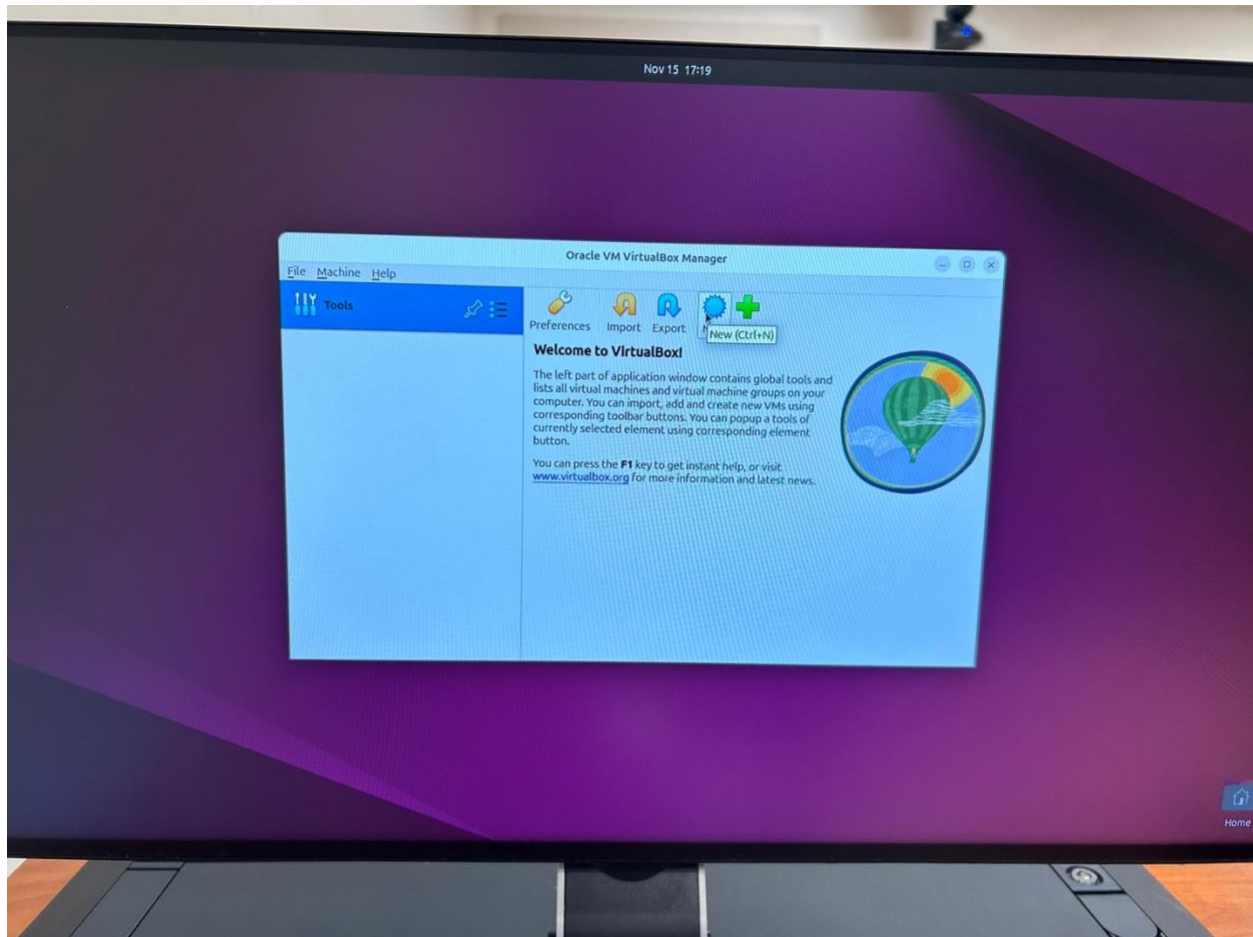

- Once at the proper site, select Ubuntu 24.04 (Noble) deb Package.
- VirtualBox software will then download.

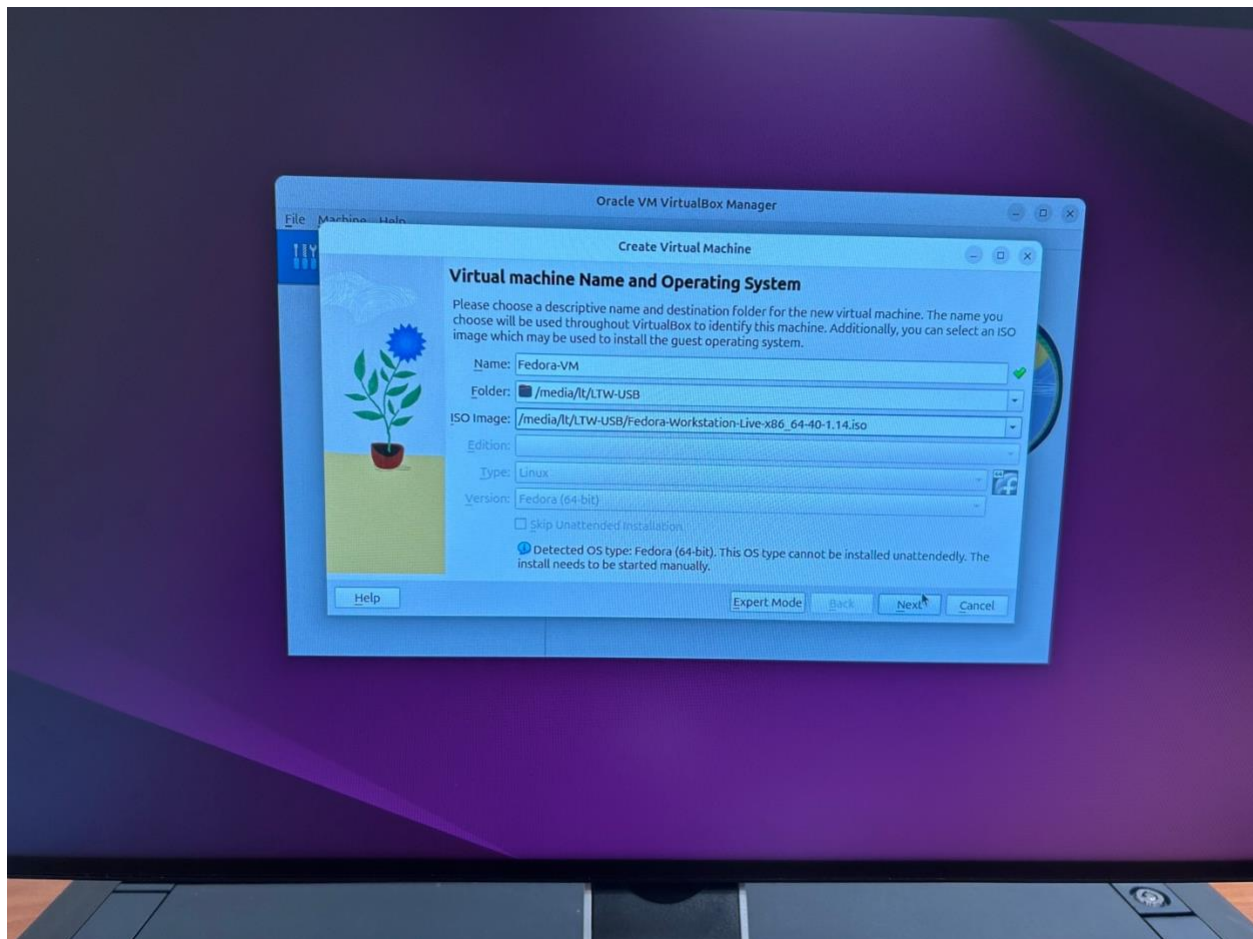

- After the deb Package downloads, select the Install button.

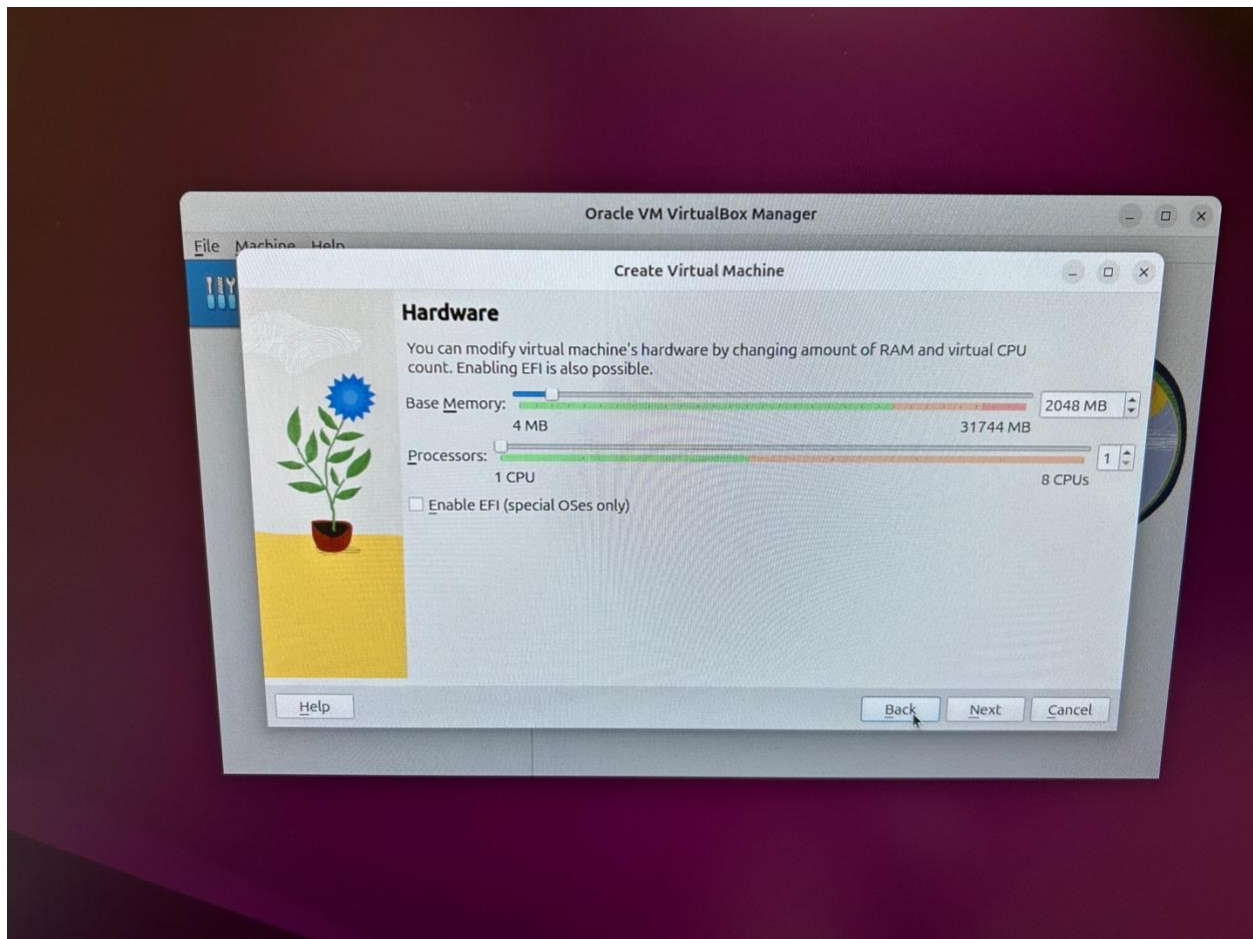

- In the menu plane, select Oracle VM VirtualBox.

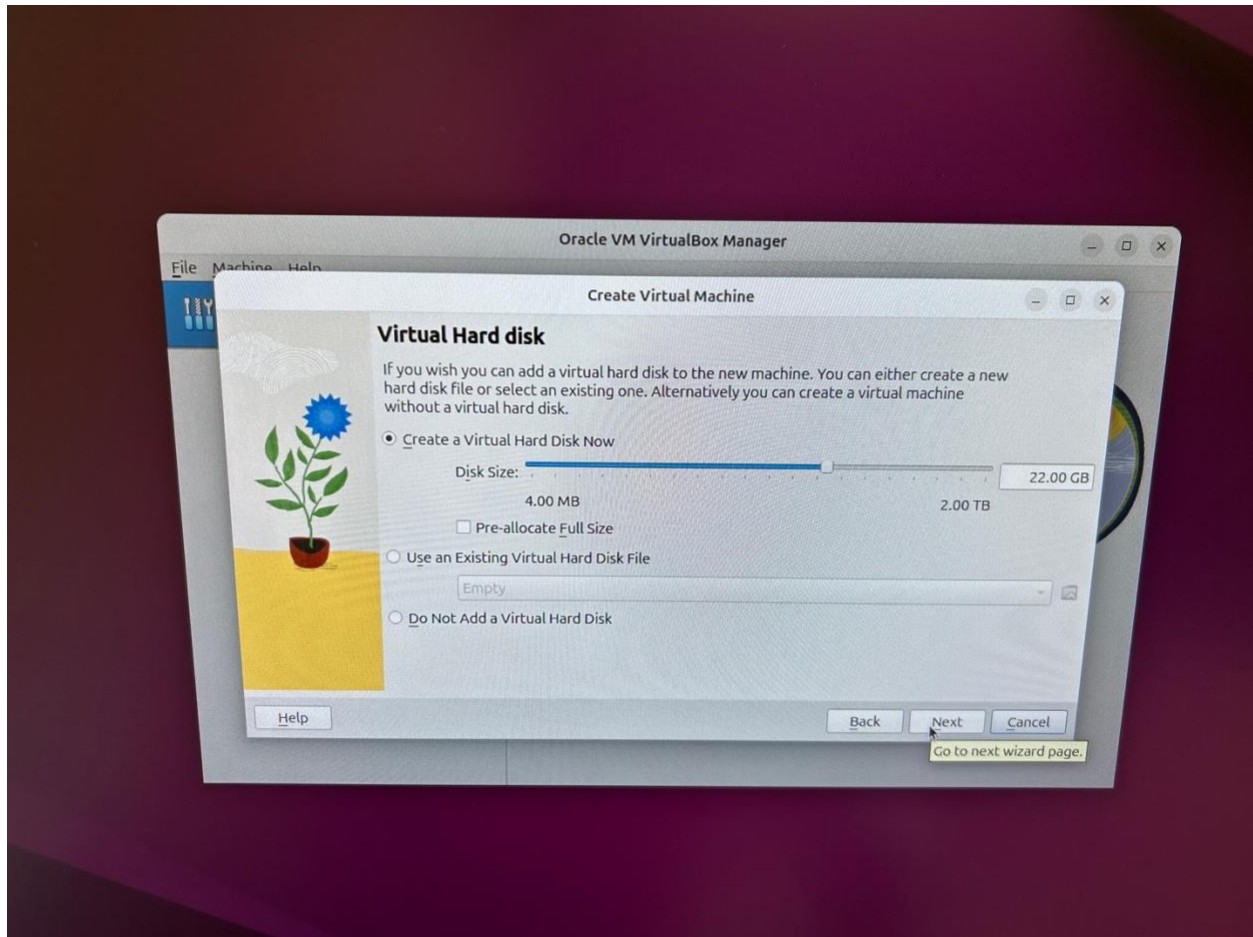

- Select new button to begin creating a virtual machine.

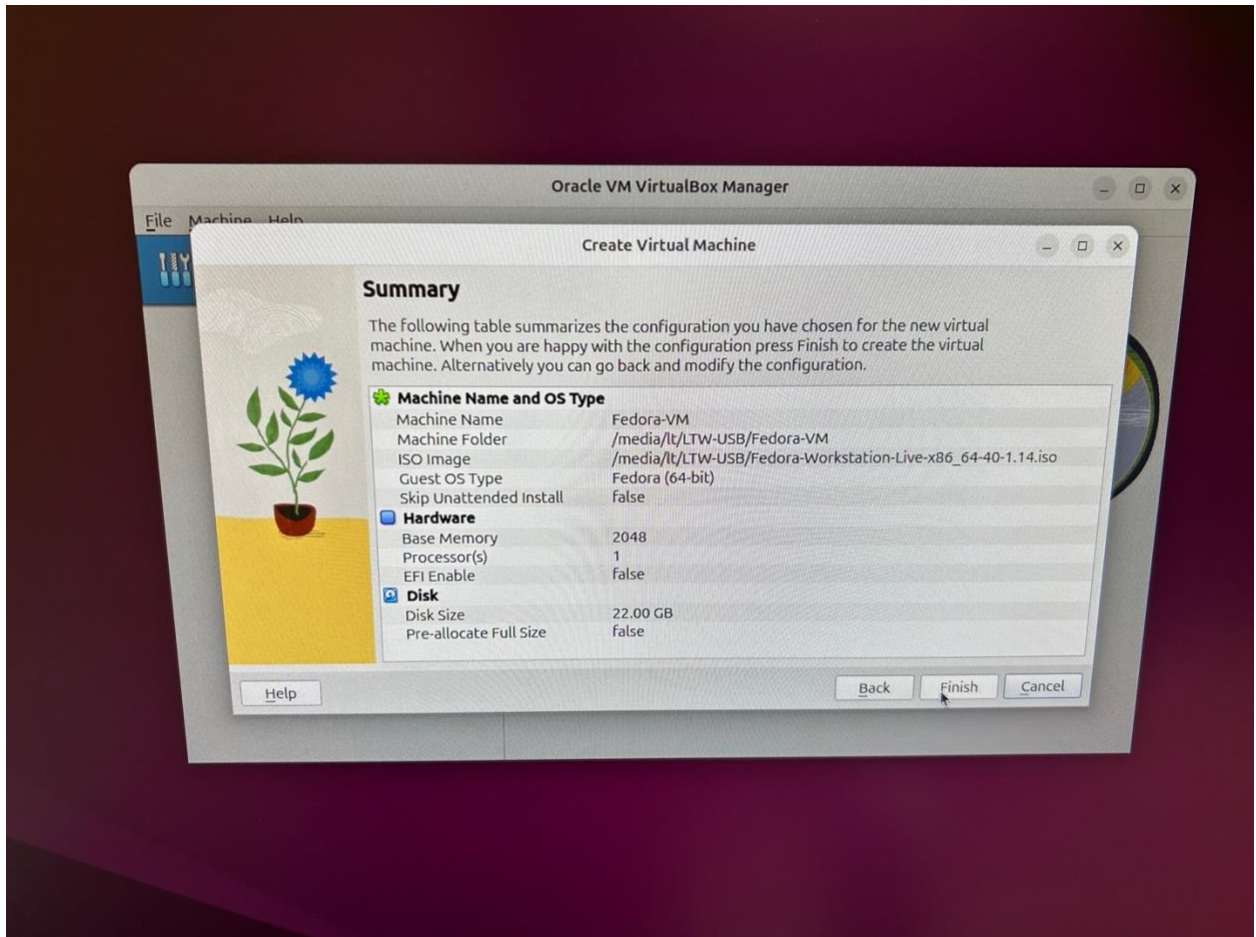

- Name the virtual machine
- Select the folder to install the virtual machine (OS chosen is Fedora).
- Then, select the ISO image for the virtual machine.
- Click Next.

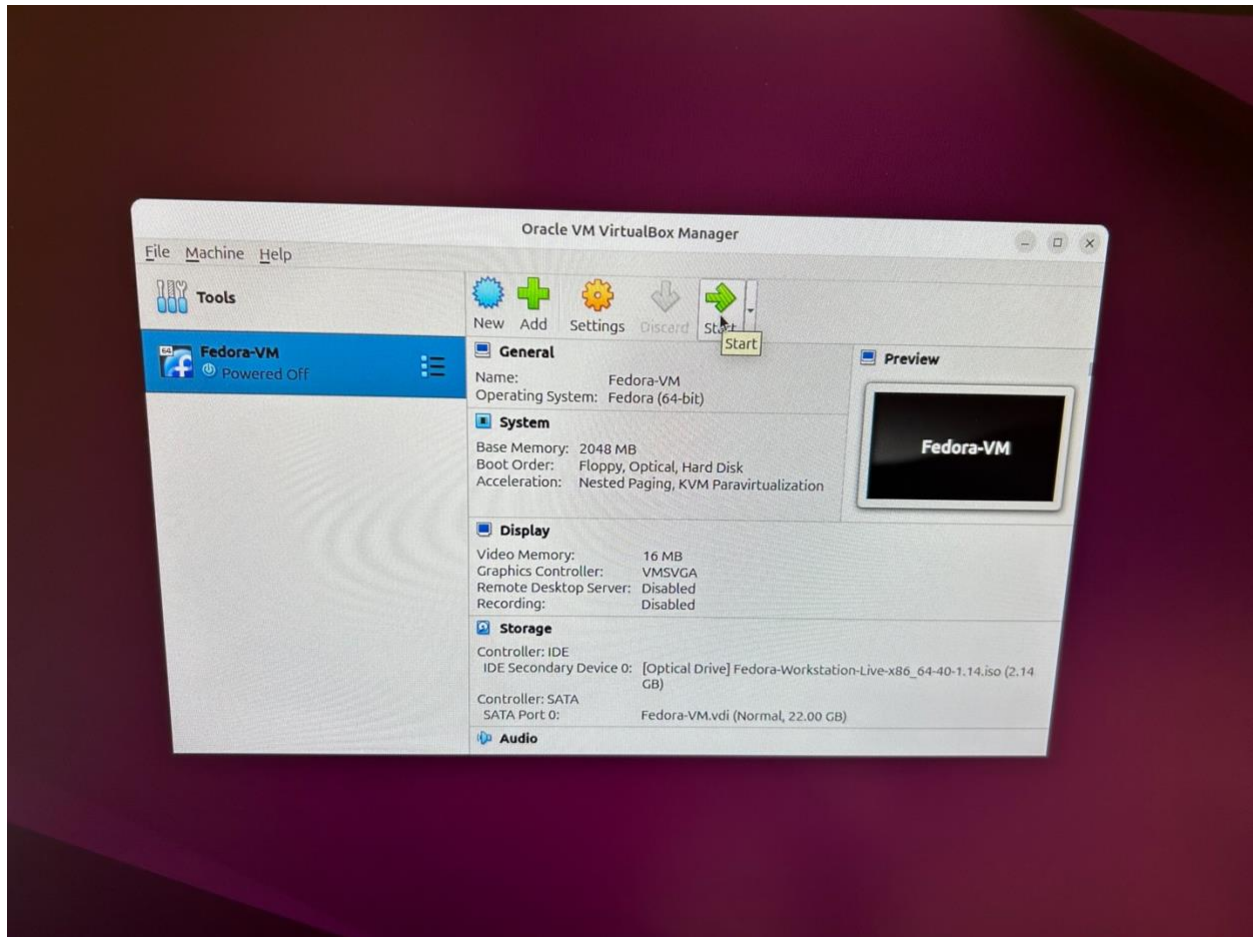

- Choose the amount of RAM to apply to the VM.

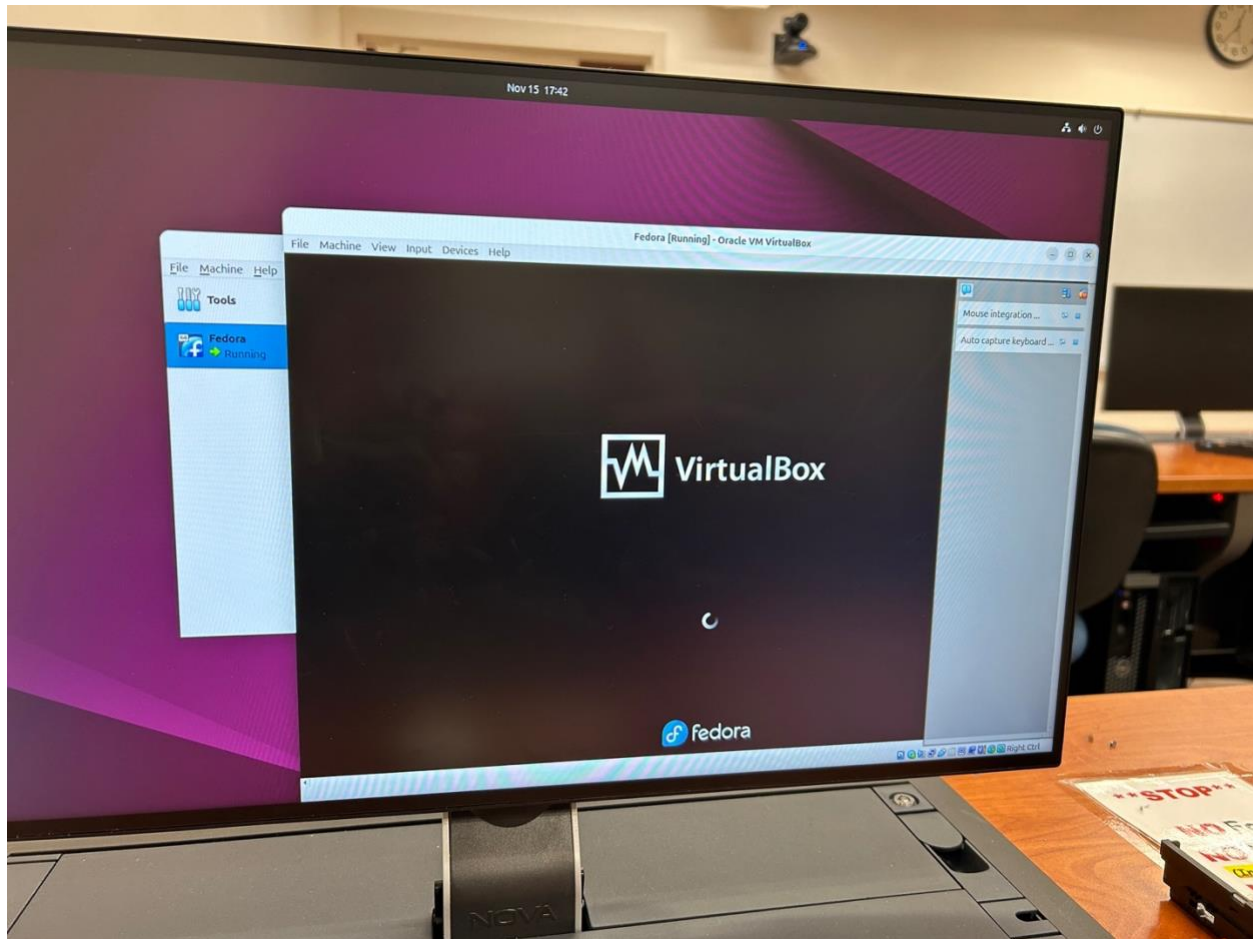

- Select the Create a Virtual Hard Disk Now.
- Enter the amount (GB) of storage to allow in the VM.

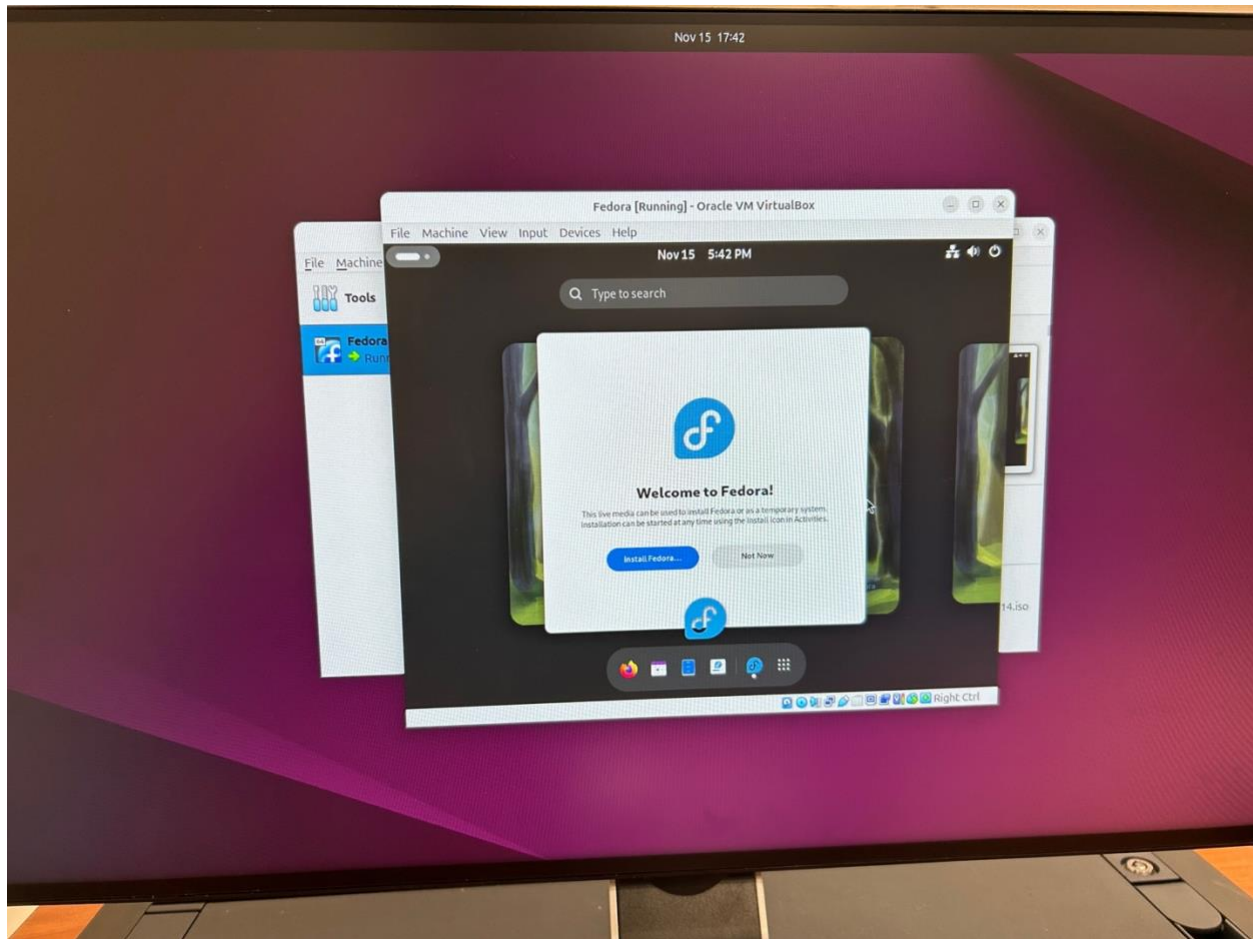

- Review summary of installation of Ubuntu OS.
- Click finish.

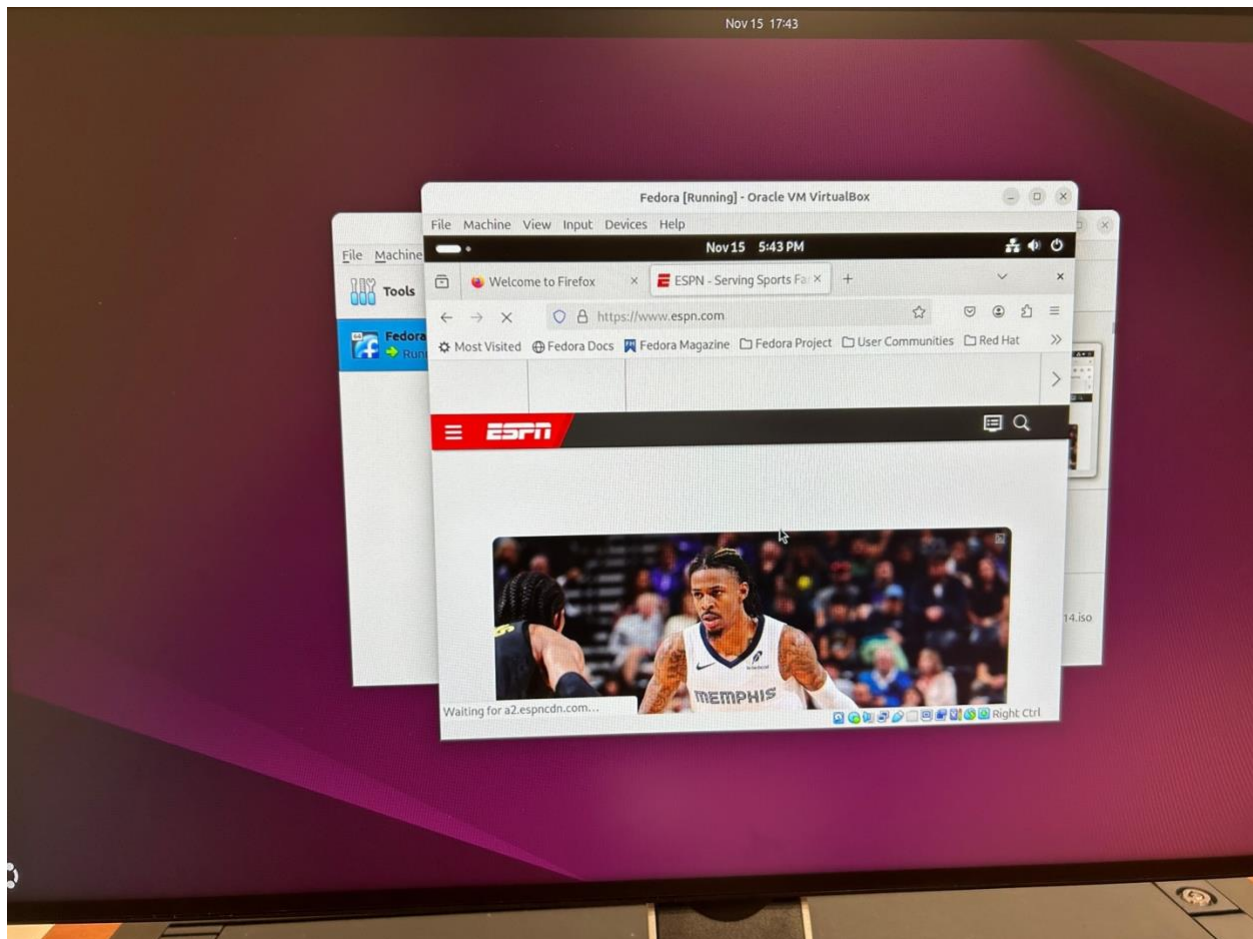

- Once down setting the parameters for the Fedora VM, select start to power on the machine.

- Virtual box will begin to open and start the install process for Fedora OS.

- The Fedora interface can be seen. The OS is now ready to use.

- Open Firefox and open a tab to access non Bowiestate.edu servers.
