Lab 3 – Virtual Machines within Windows 11 and 10

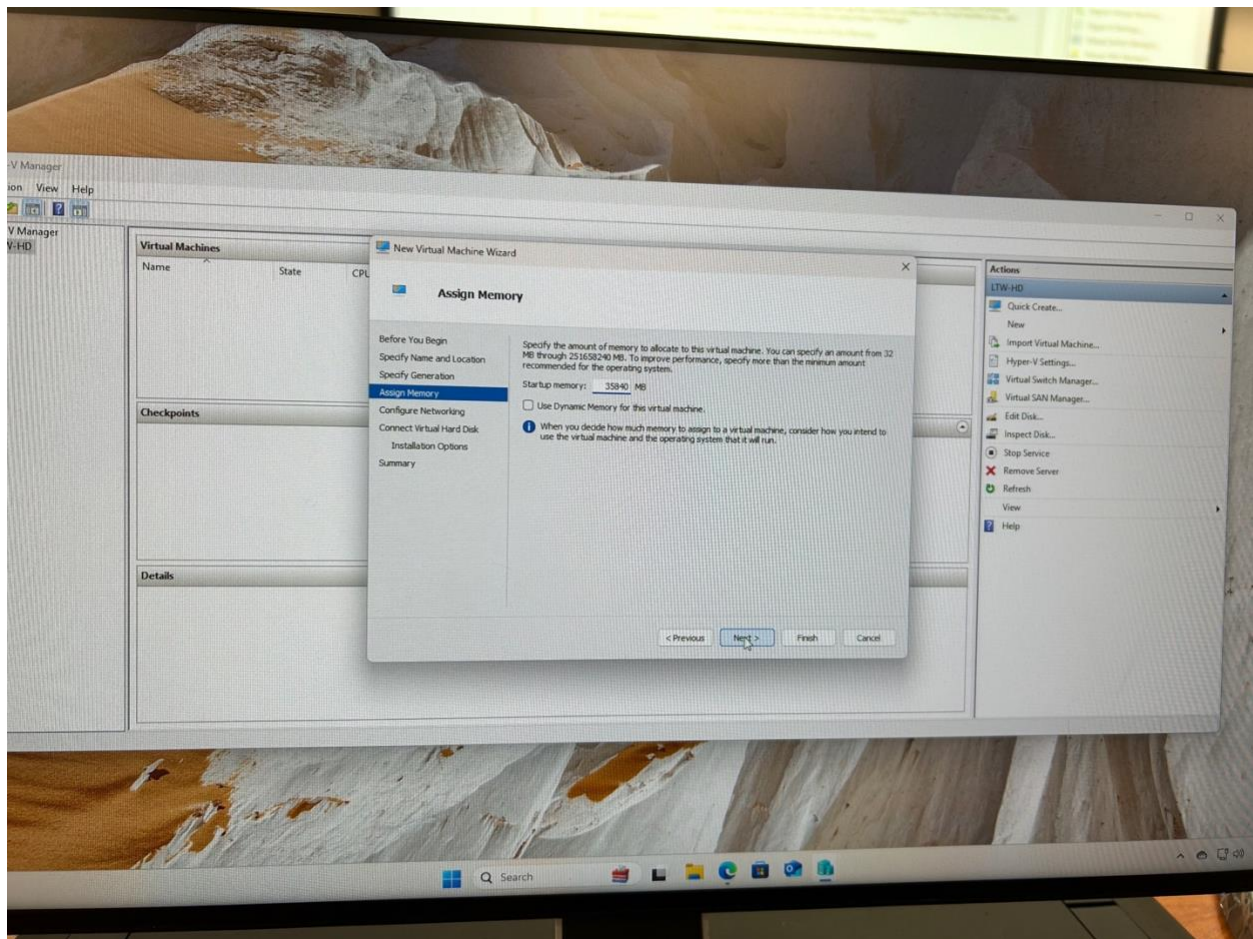

Ubuntu Virtual Machine with Windows 11

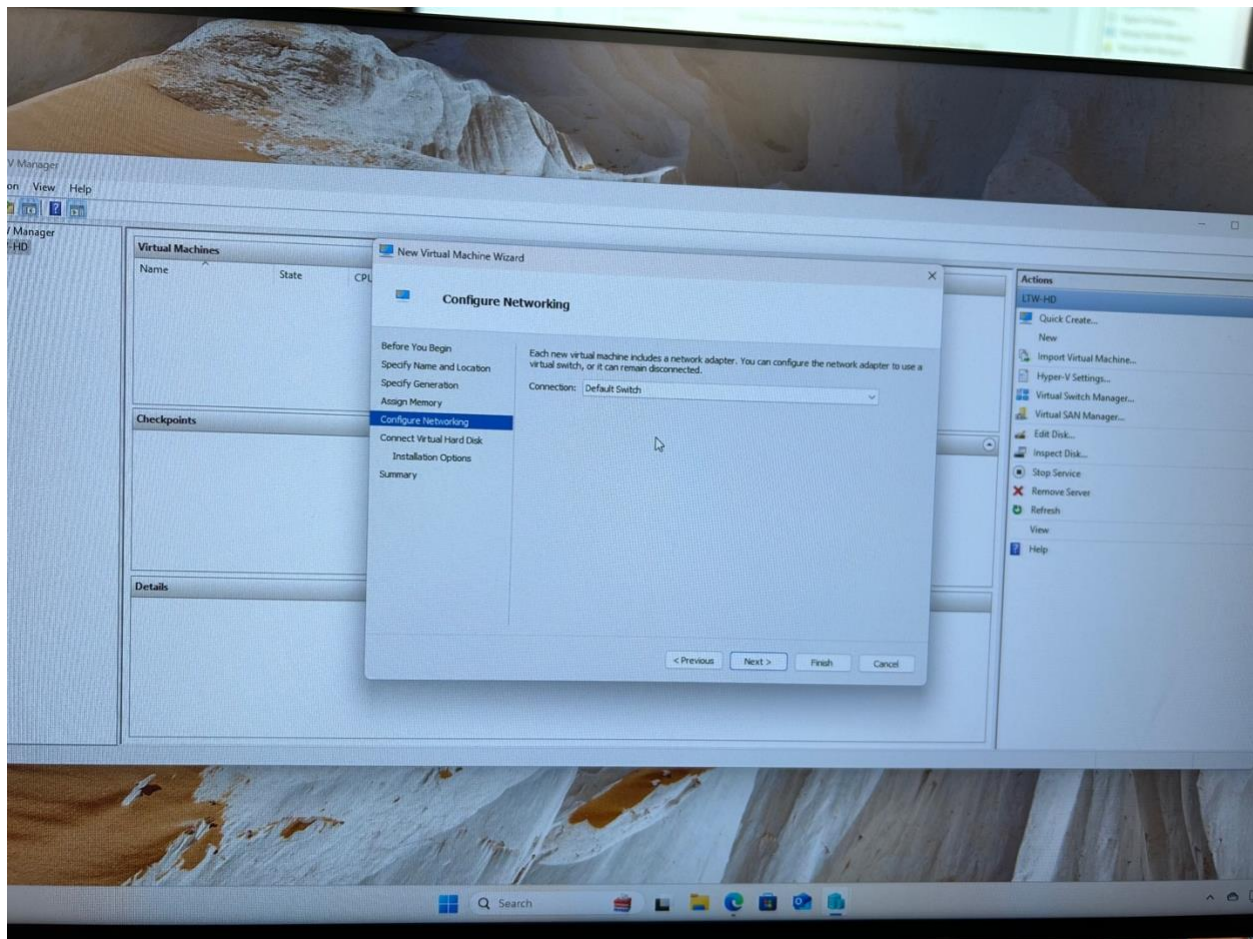

- Open the Hyper-V Manager application. Select “Action-New-Virtual Machine.”
- Name the virtual machine

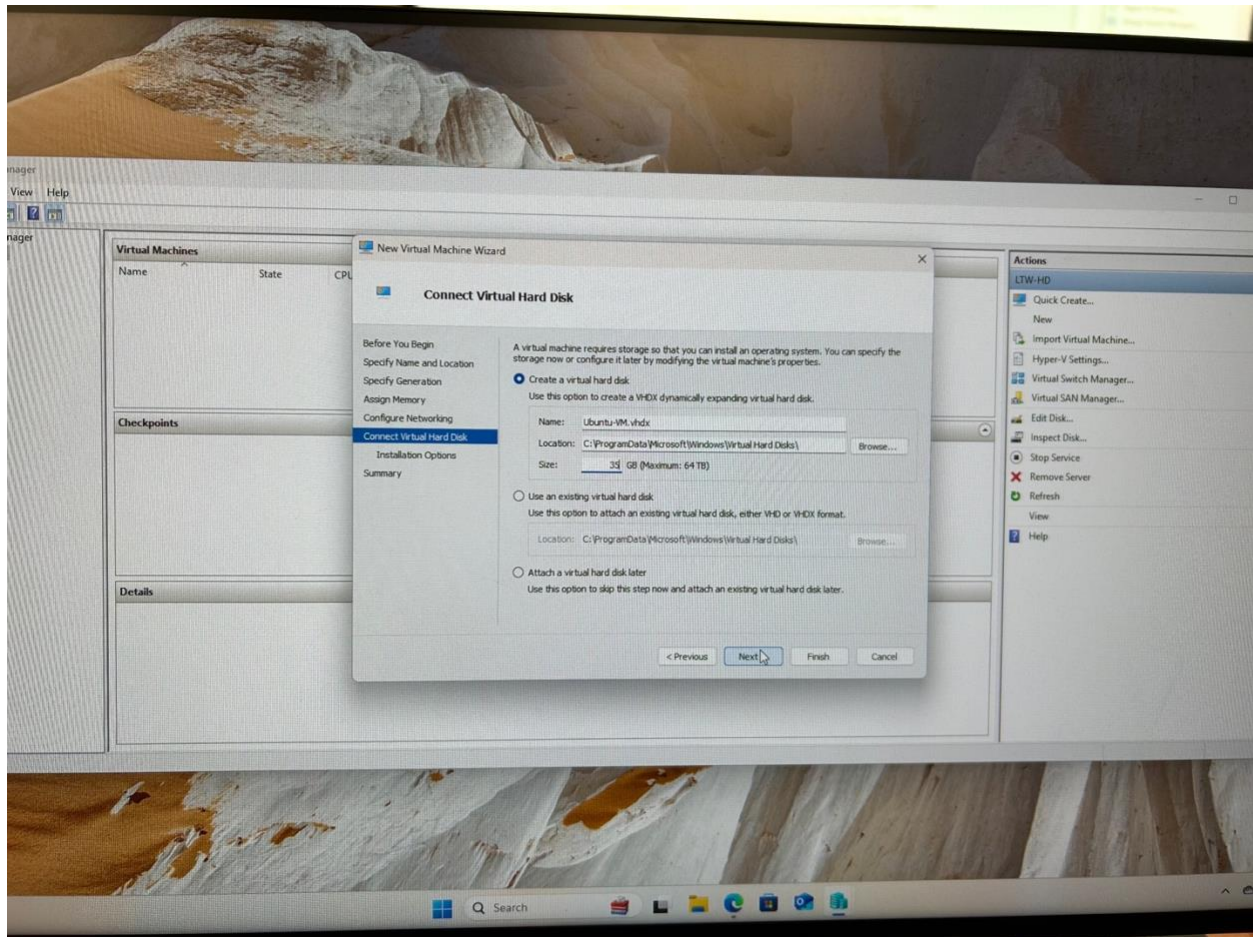

- Select Generation 1

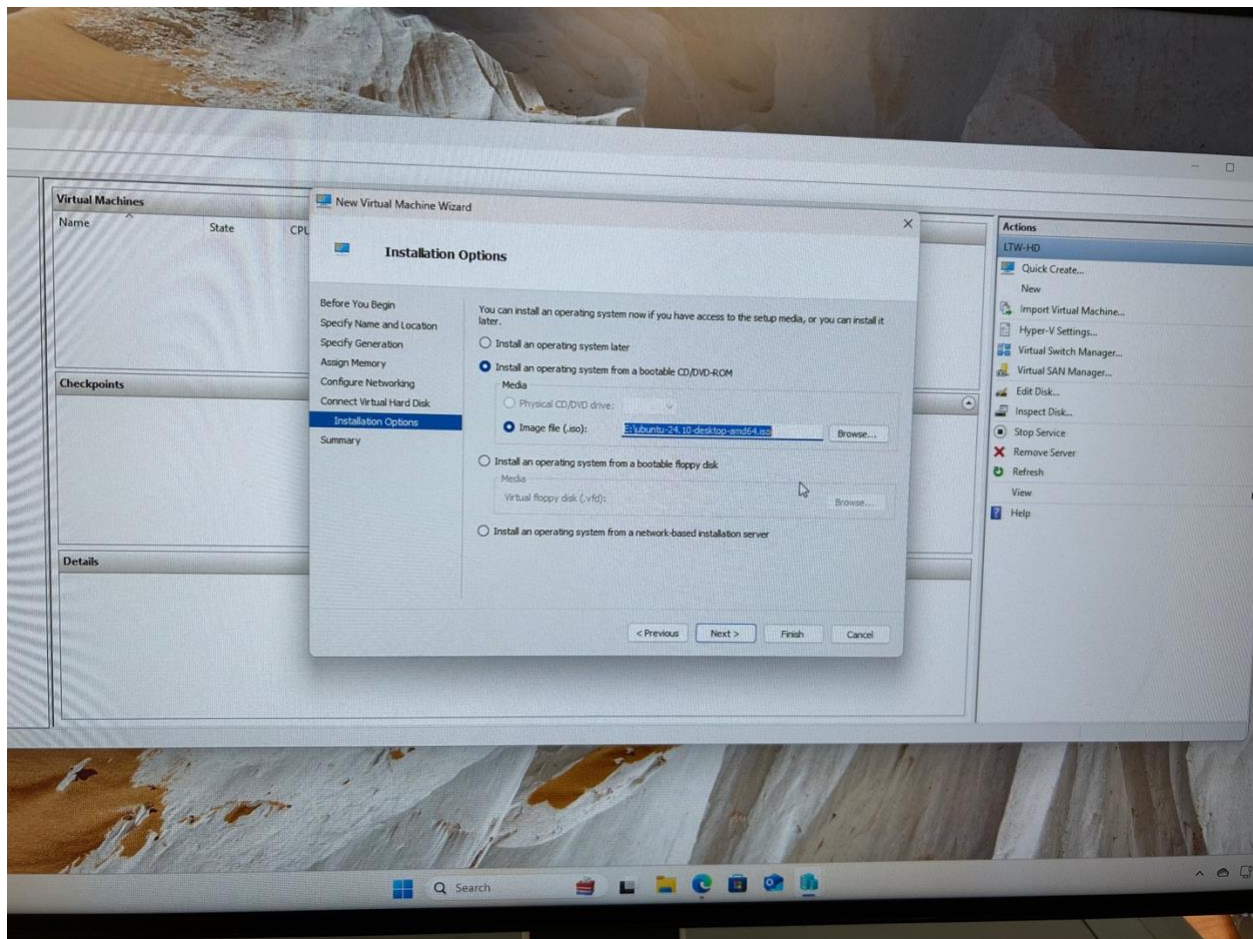

- Assign memory for RAM

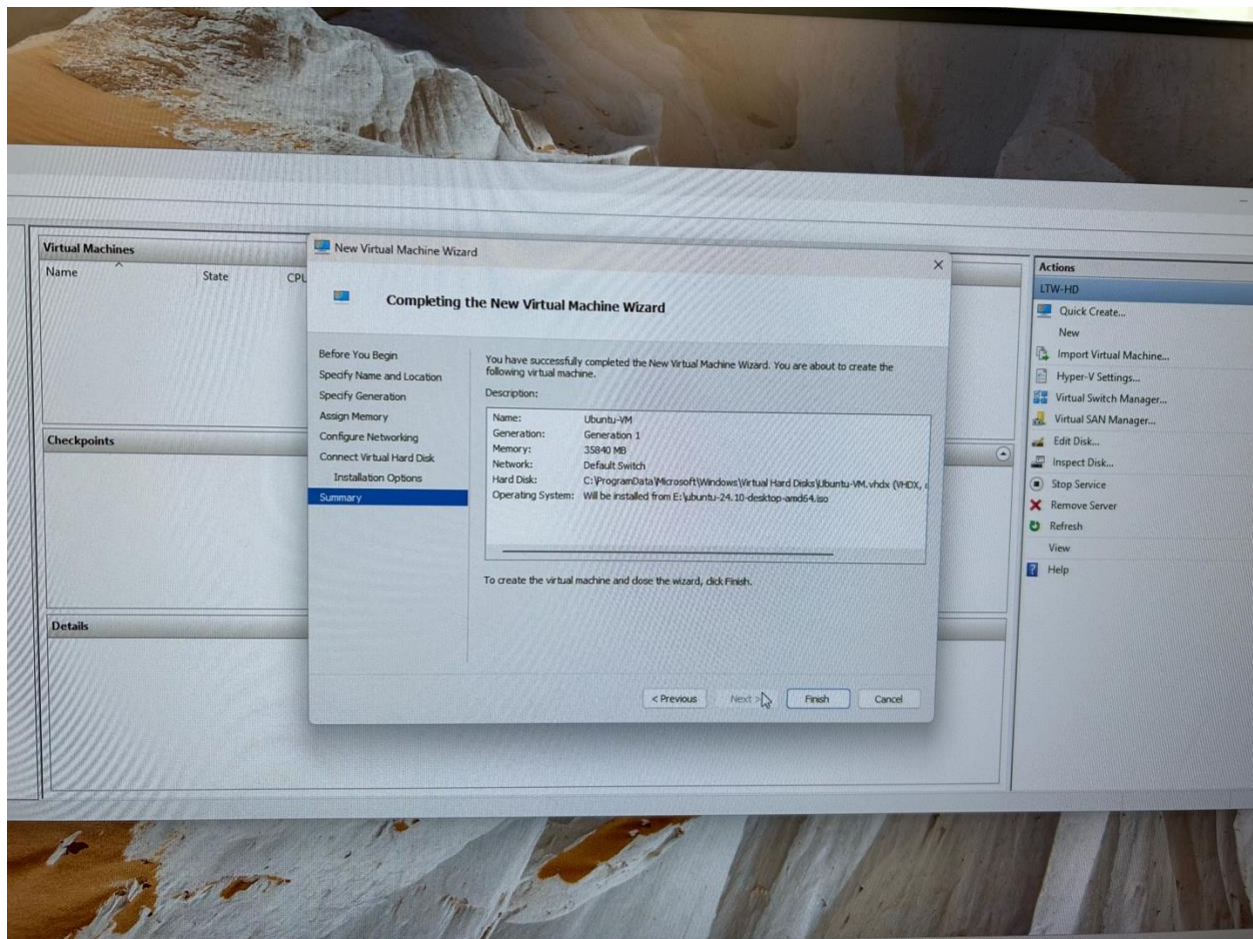

- Select “Default Switch”

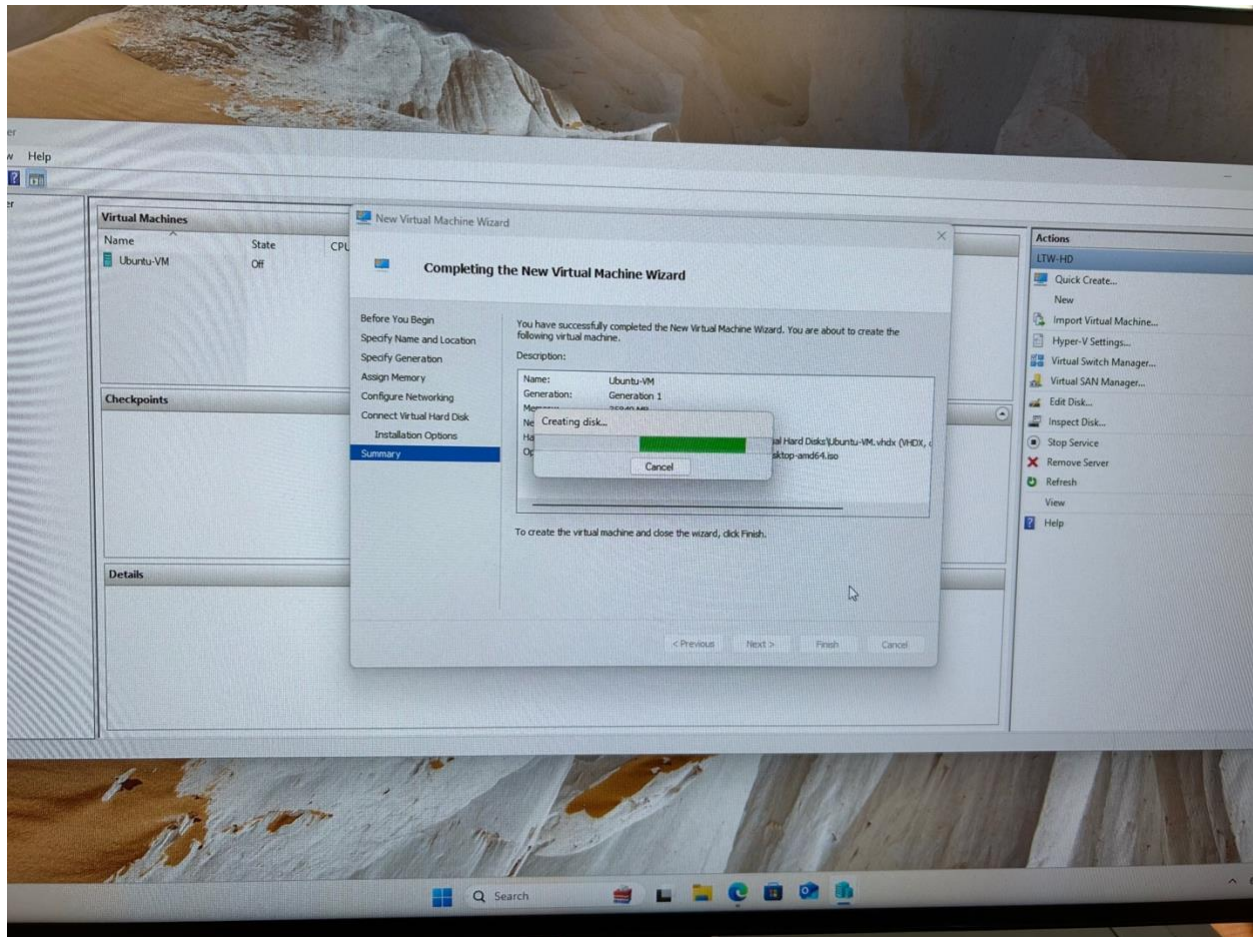

- Select “Create a virtual hard disk”
- Enter the provisioned amount in GB
- Then select next

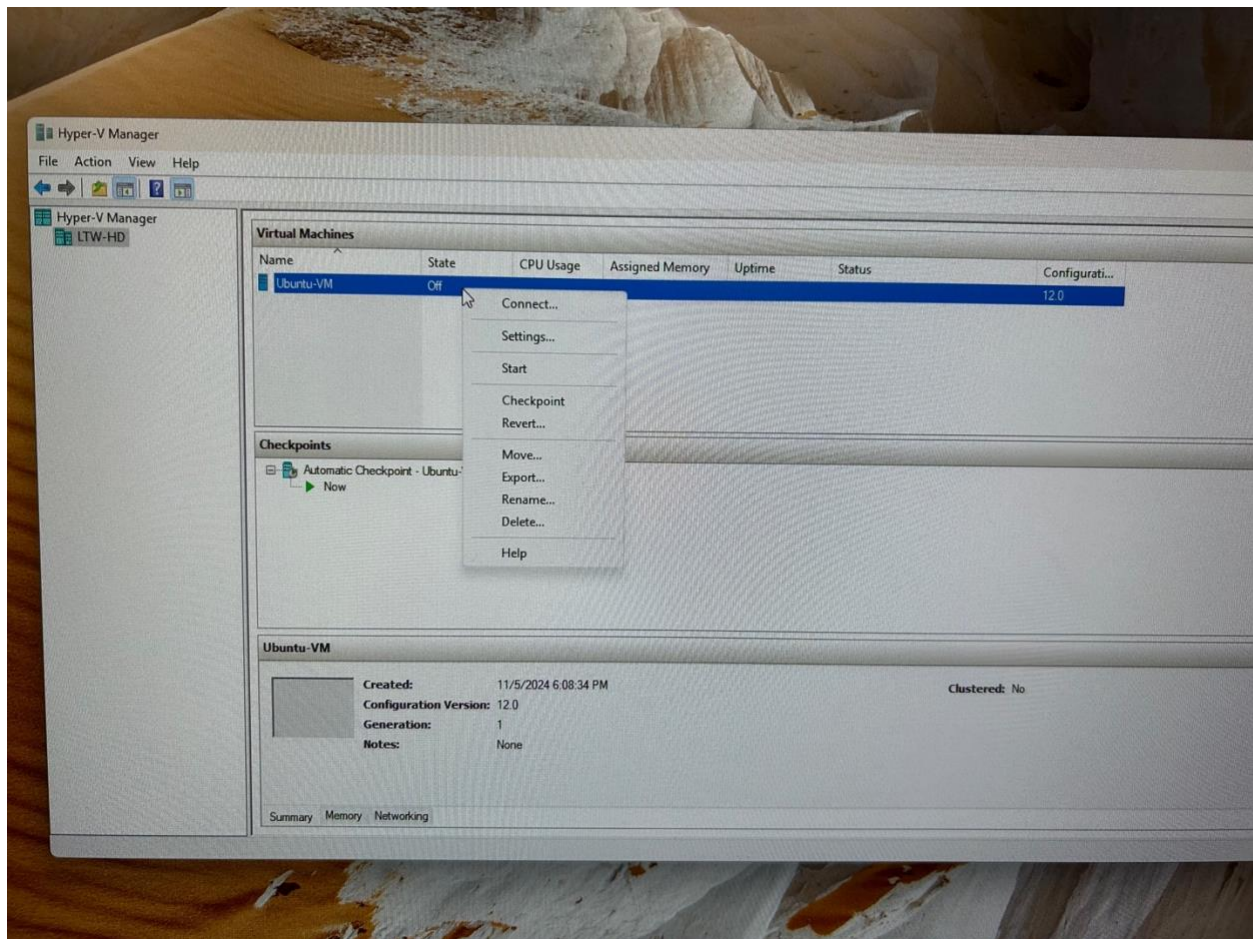

- At this point a USB should be inserted into the computer with the Ubuntu iso file.
- Select “Install an operating system from bootable CD/DVD-ROM”
- Select Image file (.iso) and locate the iso file within the USB.

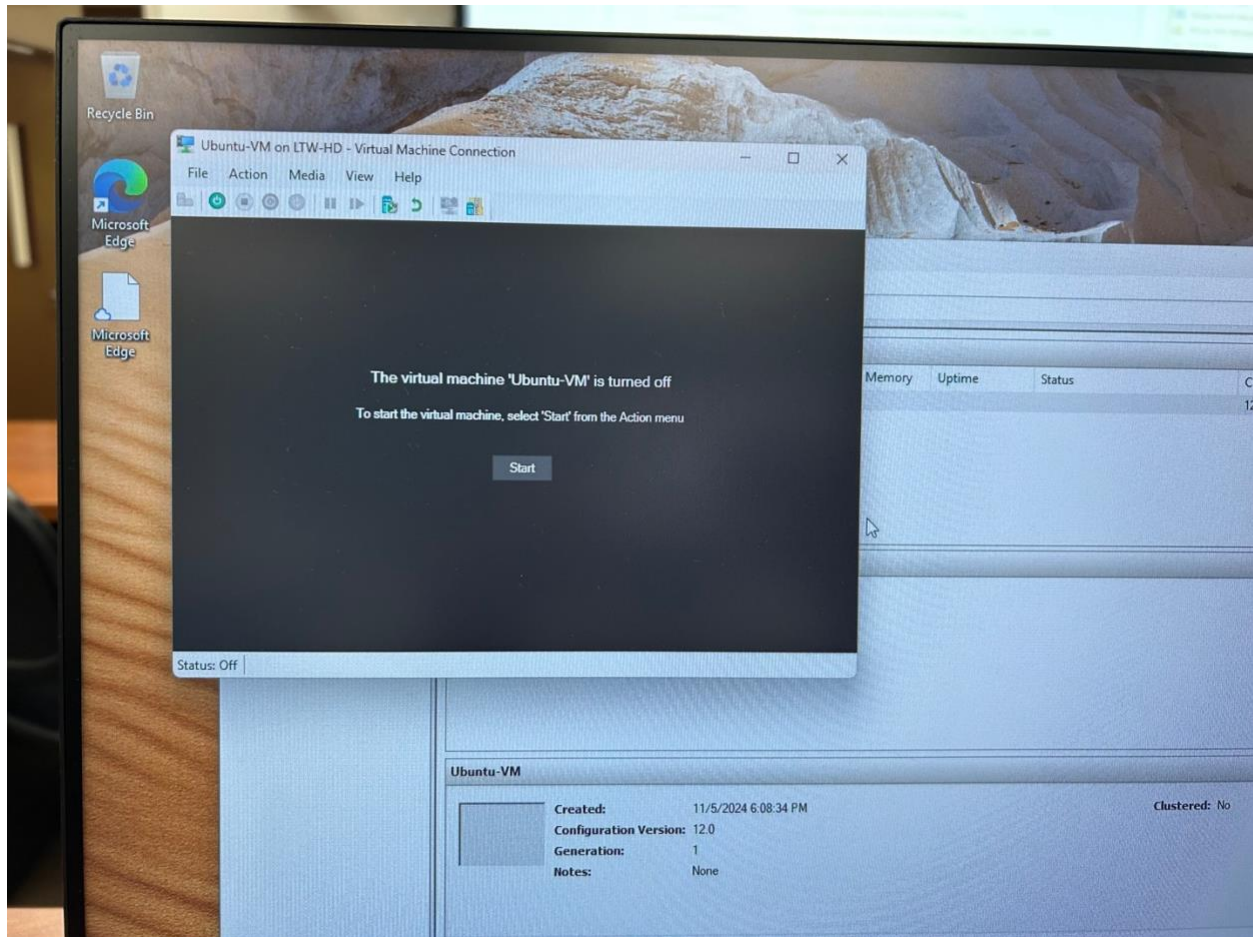

- Review information is correct before selecting next.

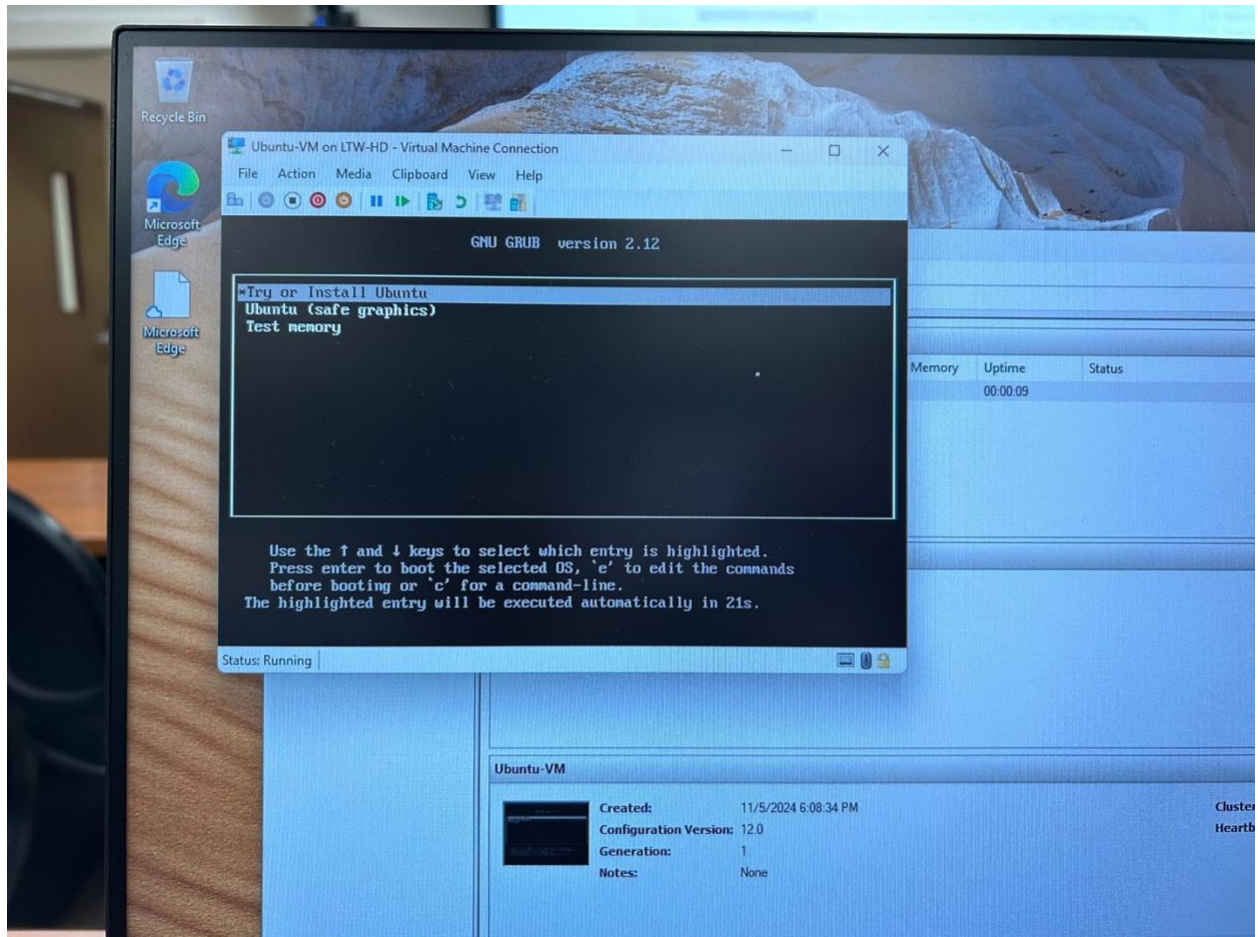

- The Hyper-V manager begins to create the Ubuntu virtual machine.

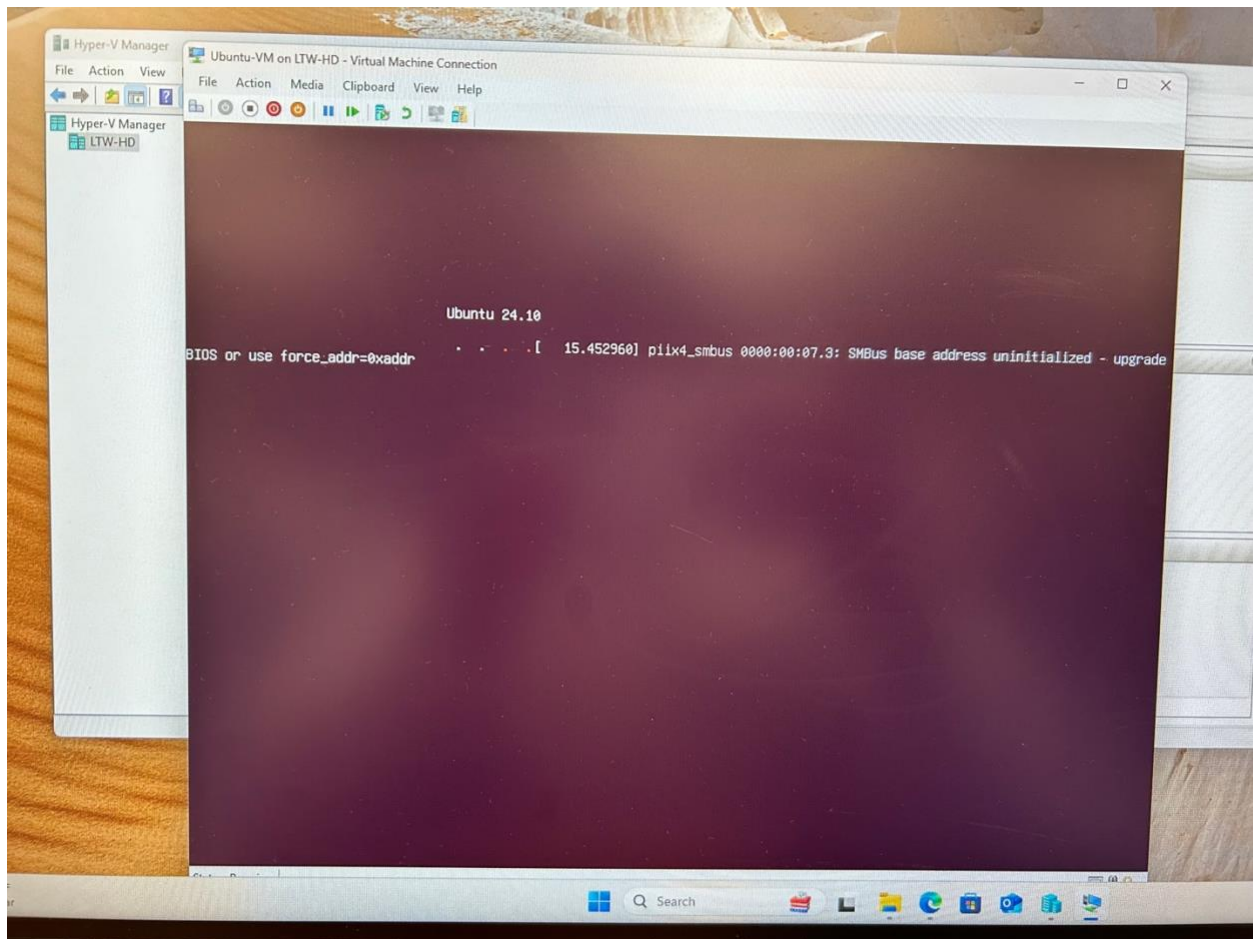

- Right click the VM and select connect

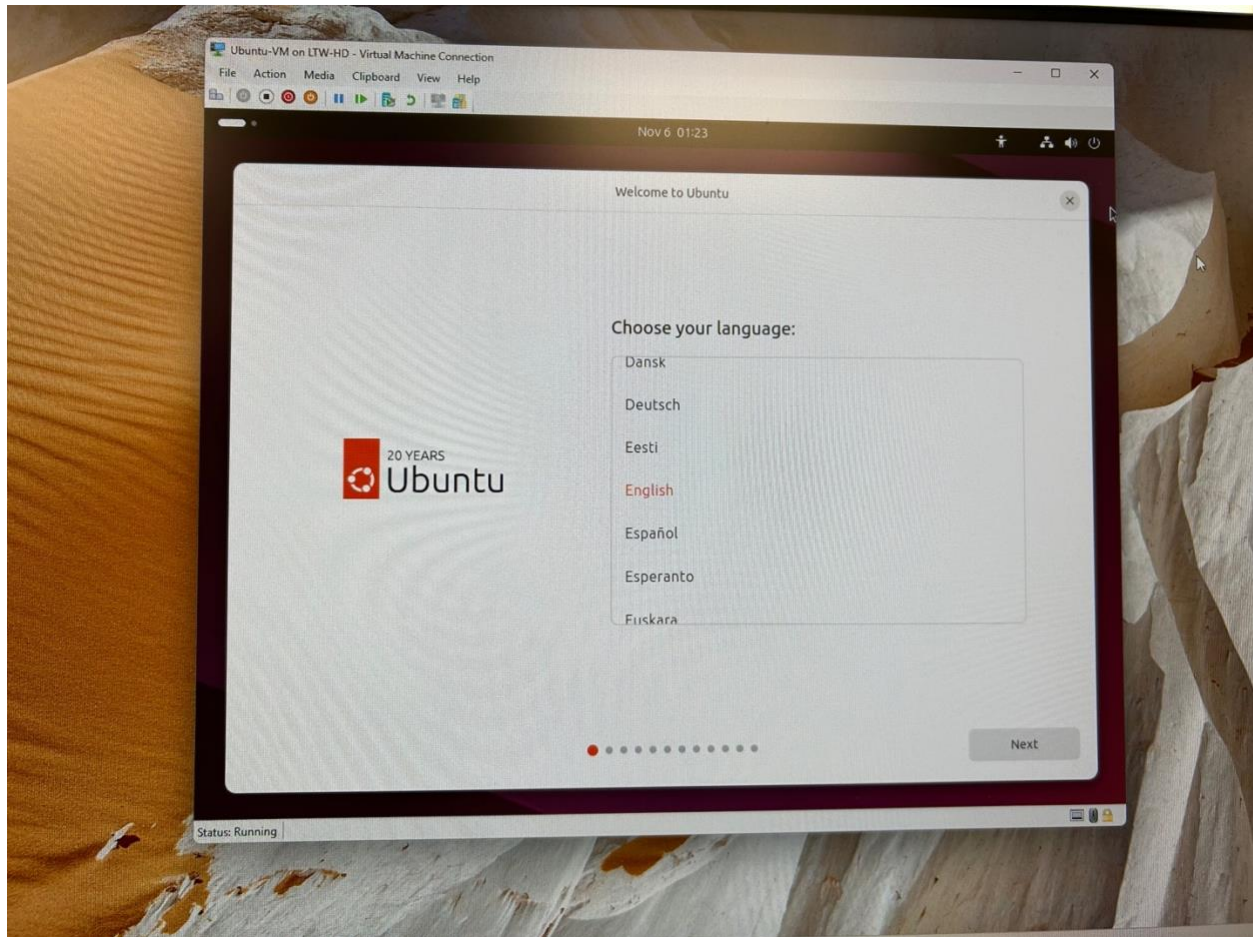

- Select start

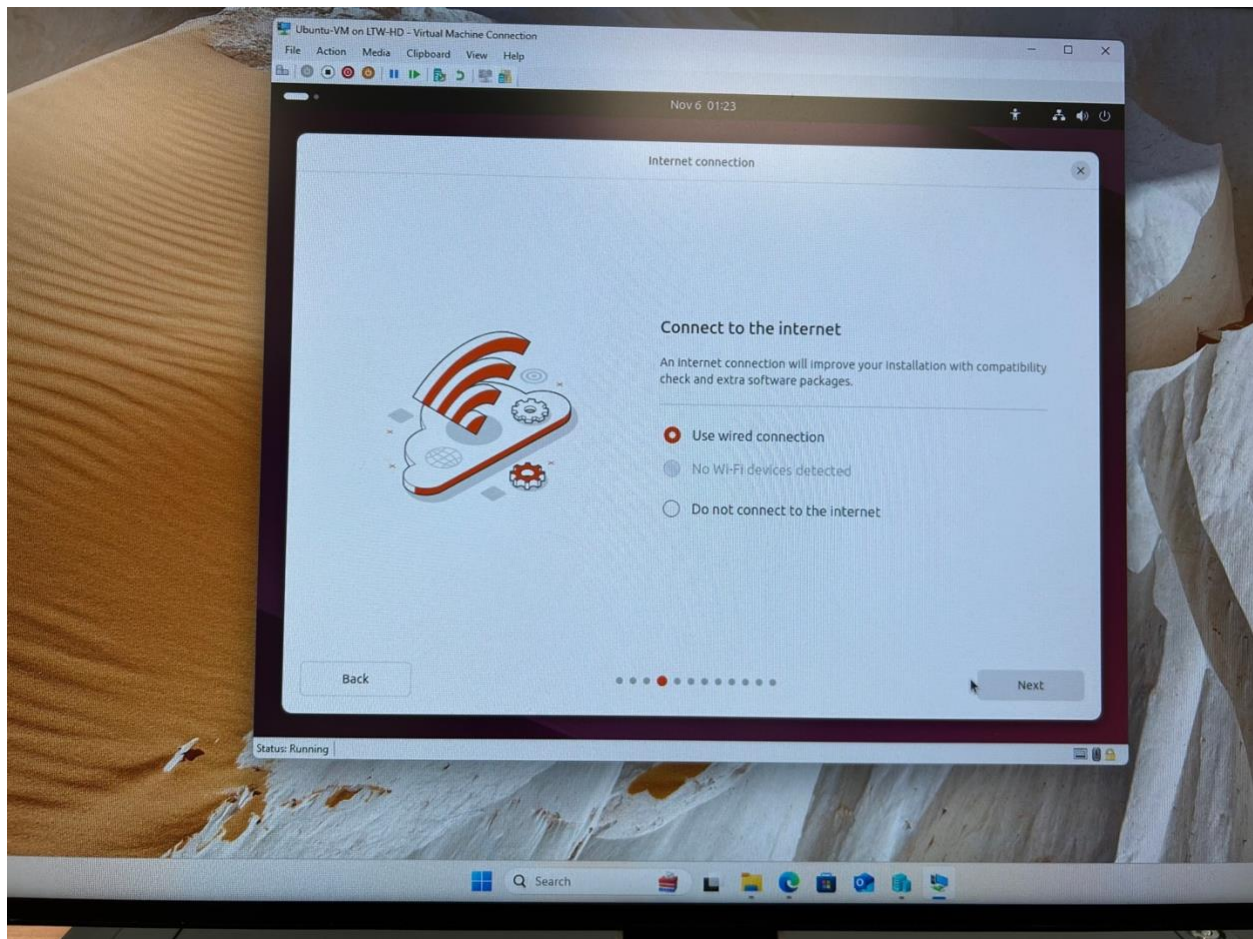

- Select try or install Ubuntu

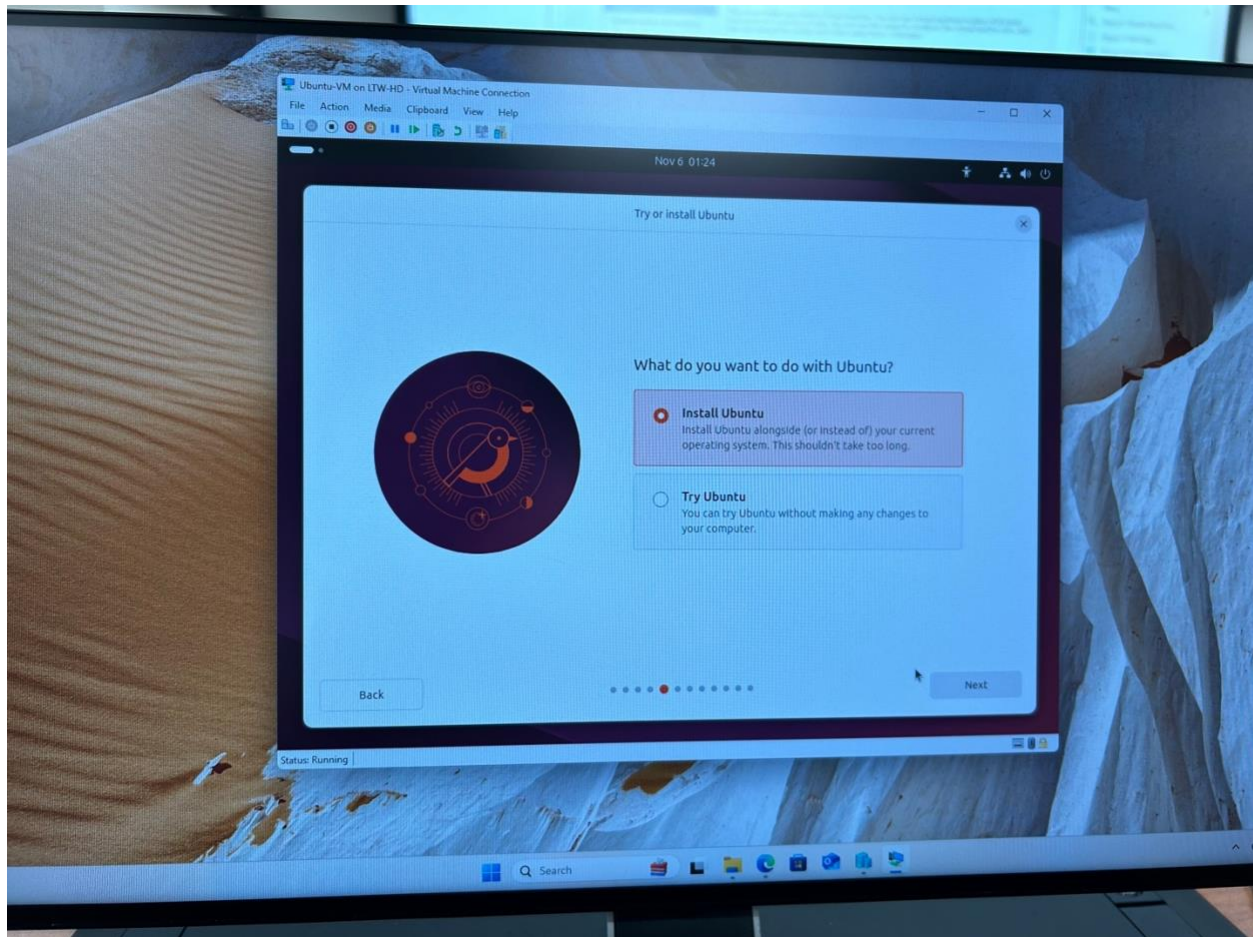

- Ubuntu begins installing

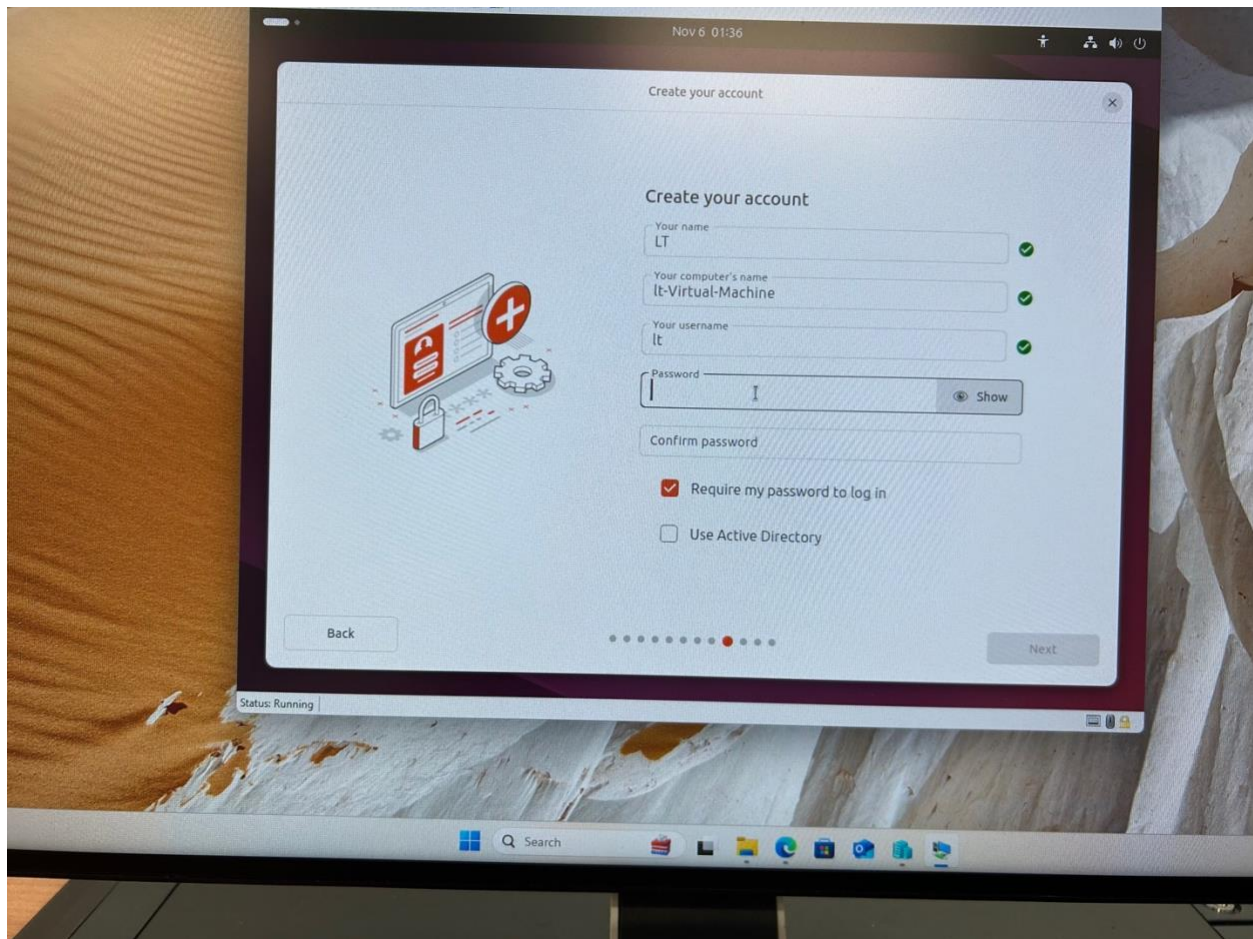

- Ubuntu is installed
- Follow the set up instructions

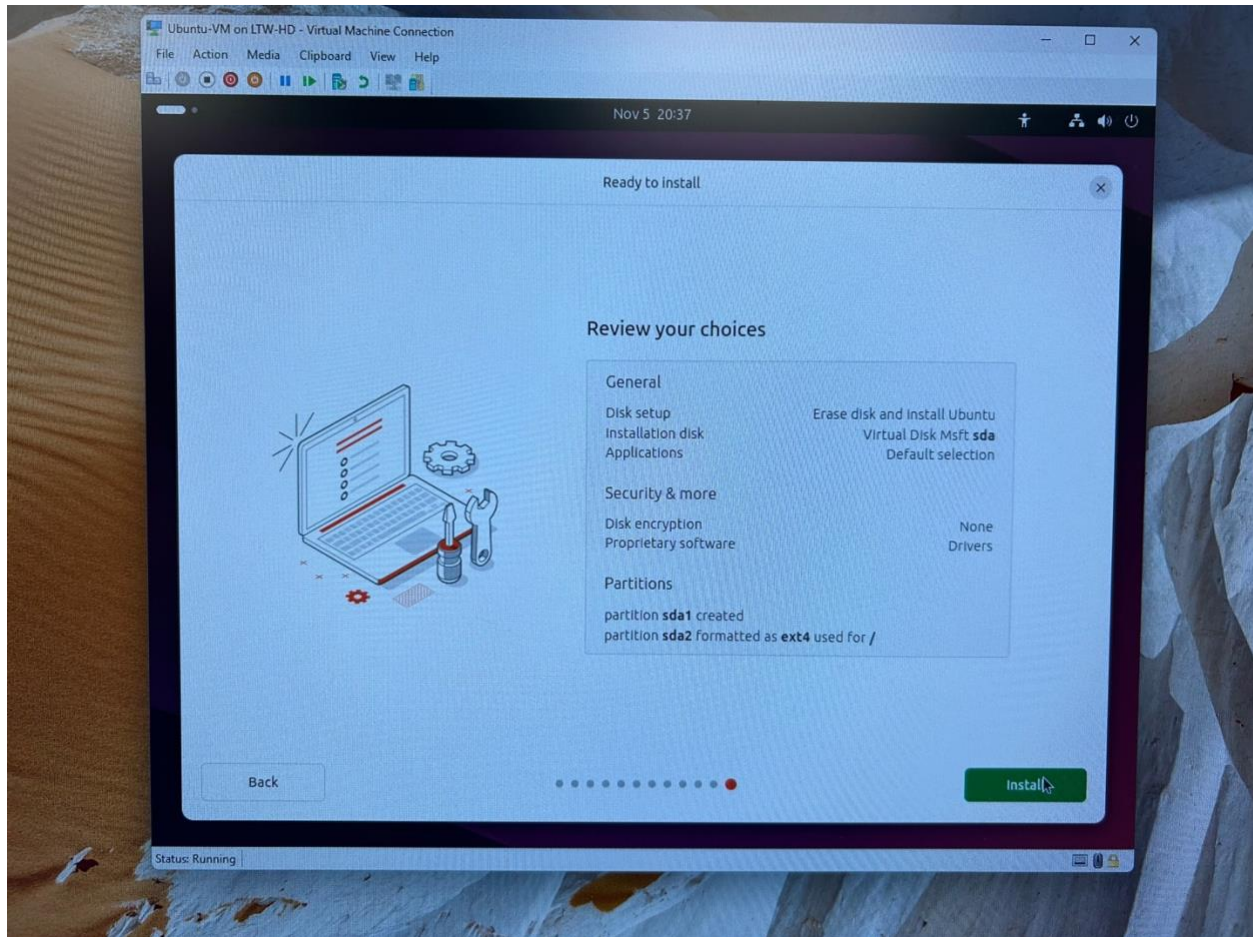

- Select “use wired connection”, to access the internet.

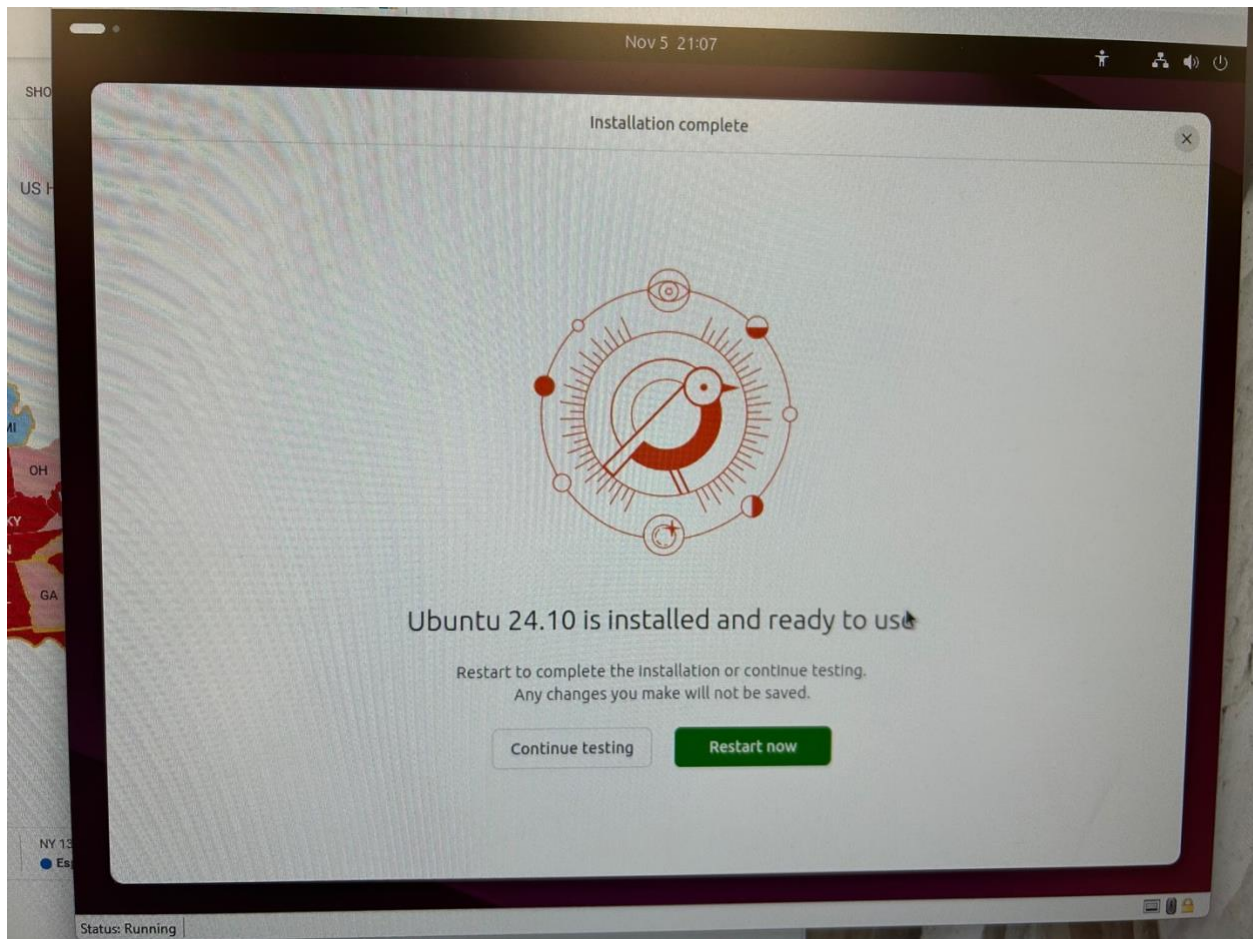

- Select install Ubuntu

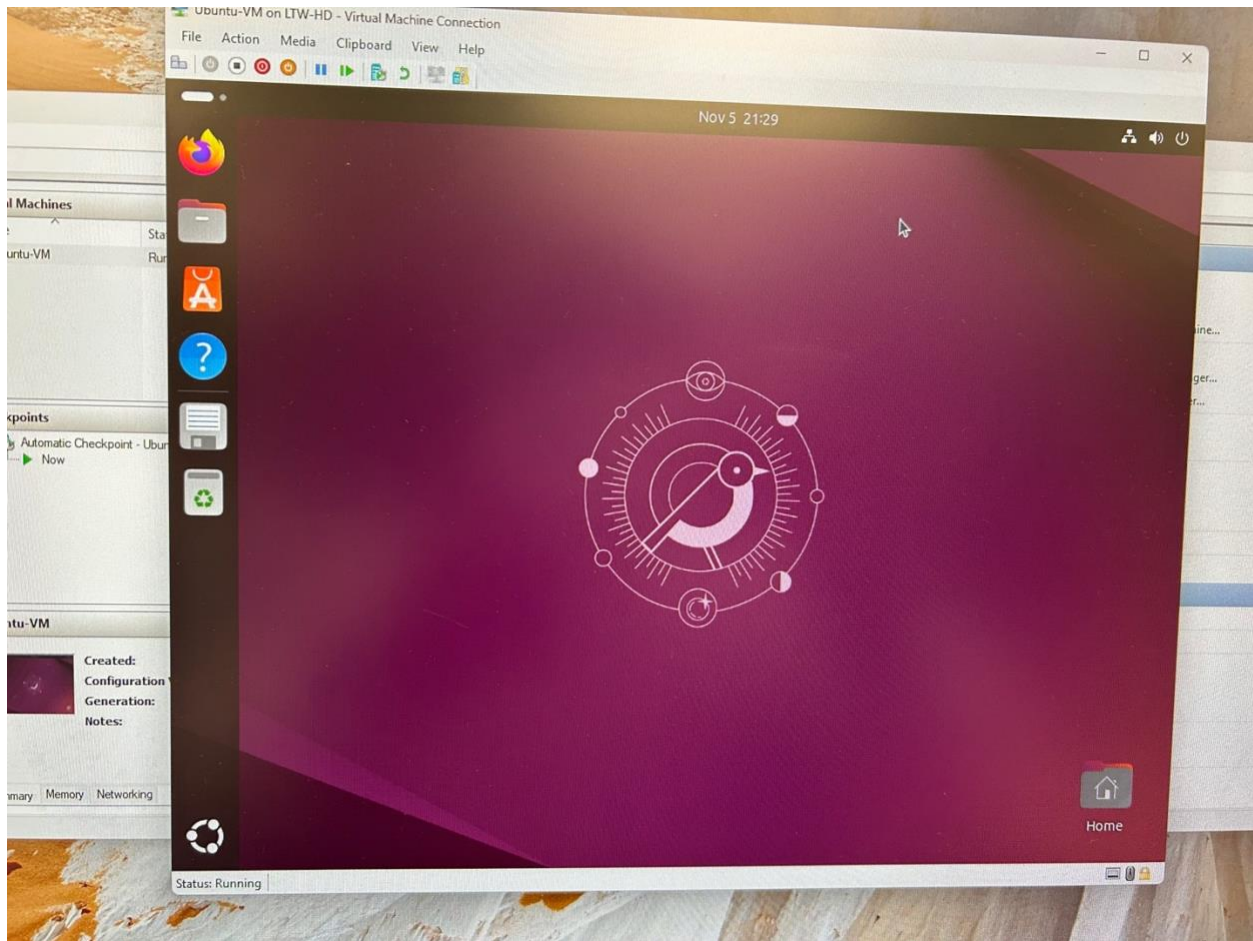

- Create an account

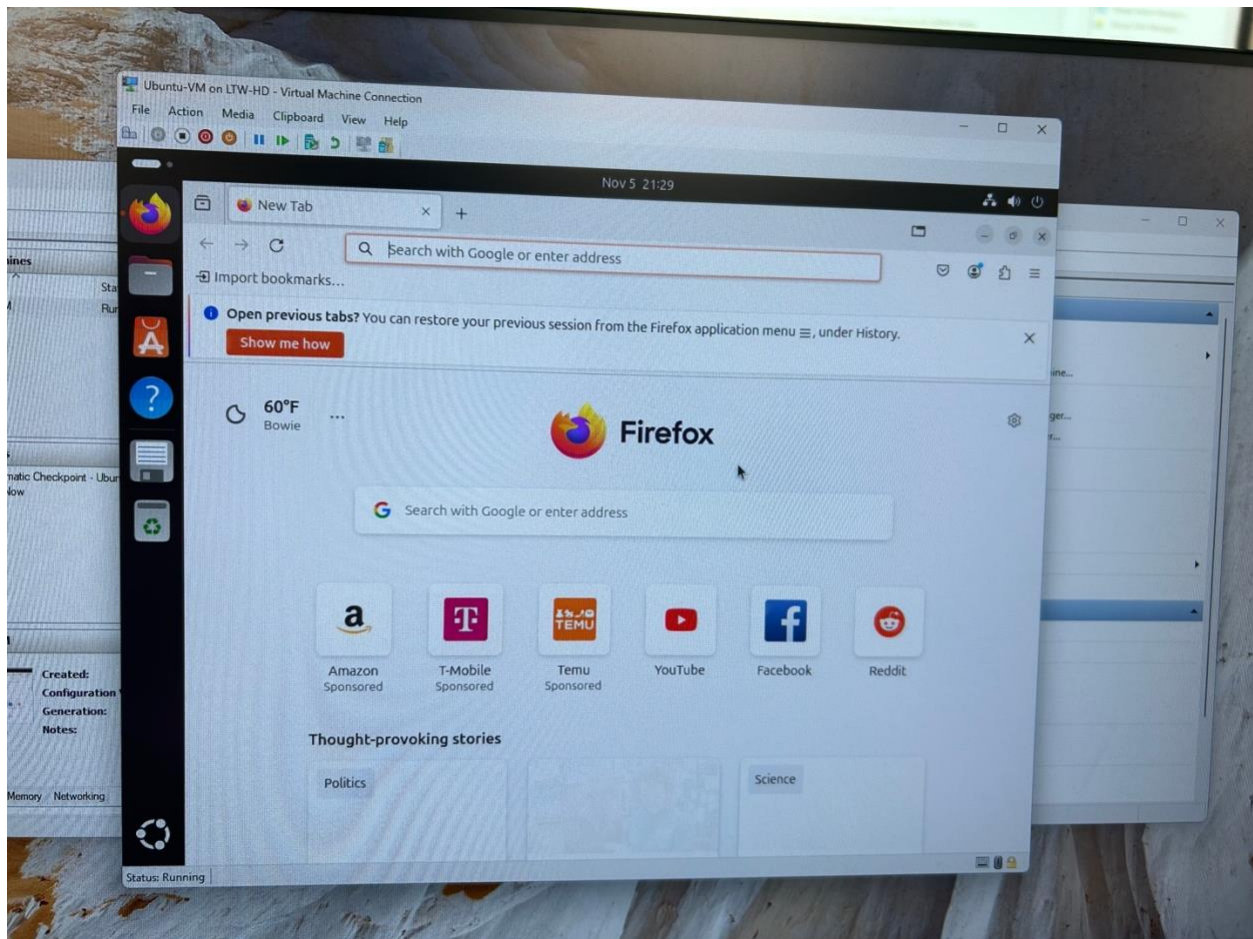

- Review information and select install.

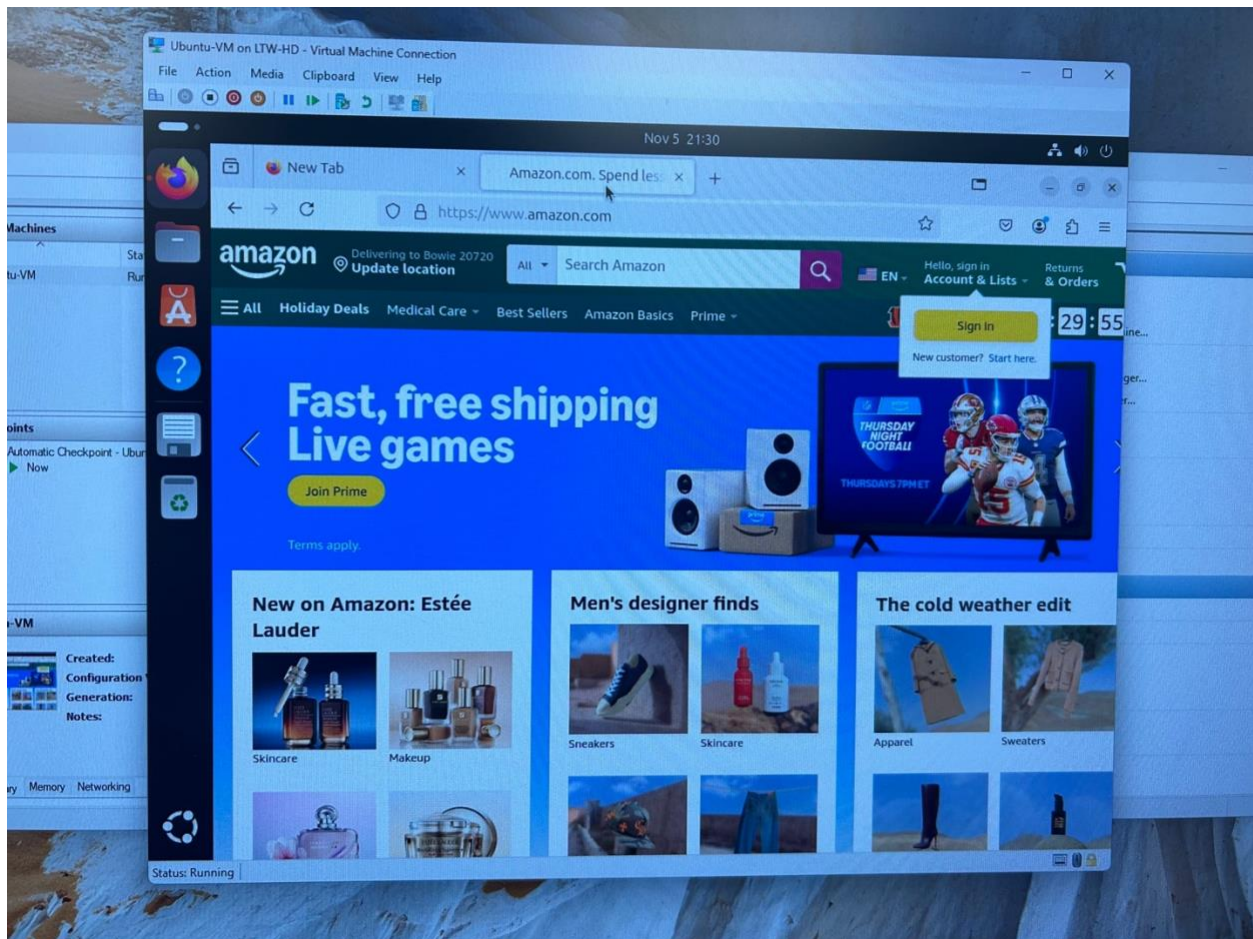

- Ubuntu is installed and ready to use.

- Ubuntu's interface

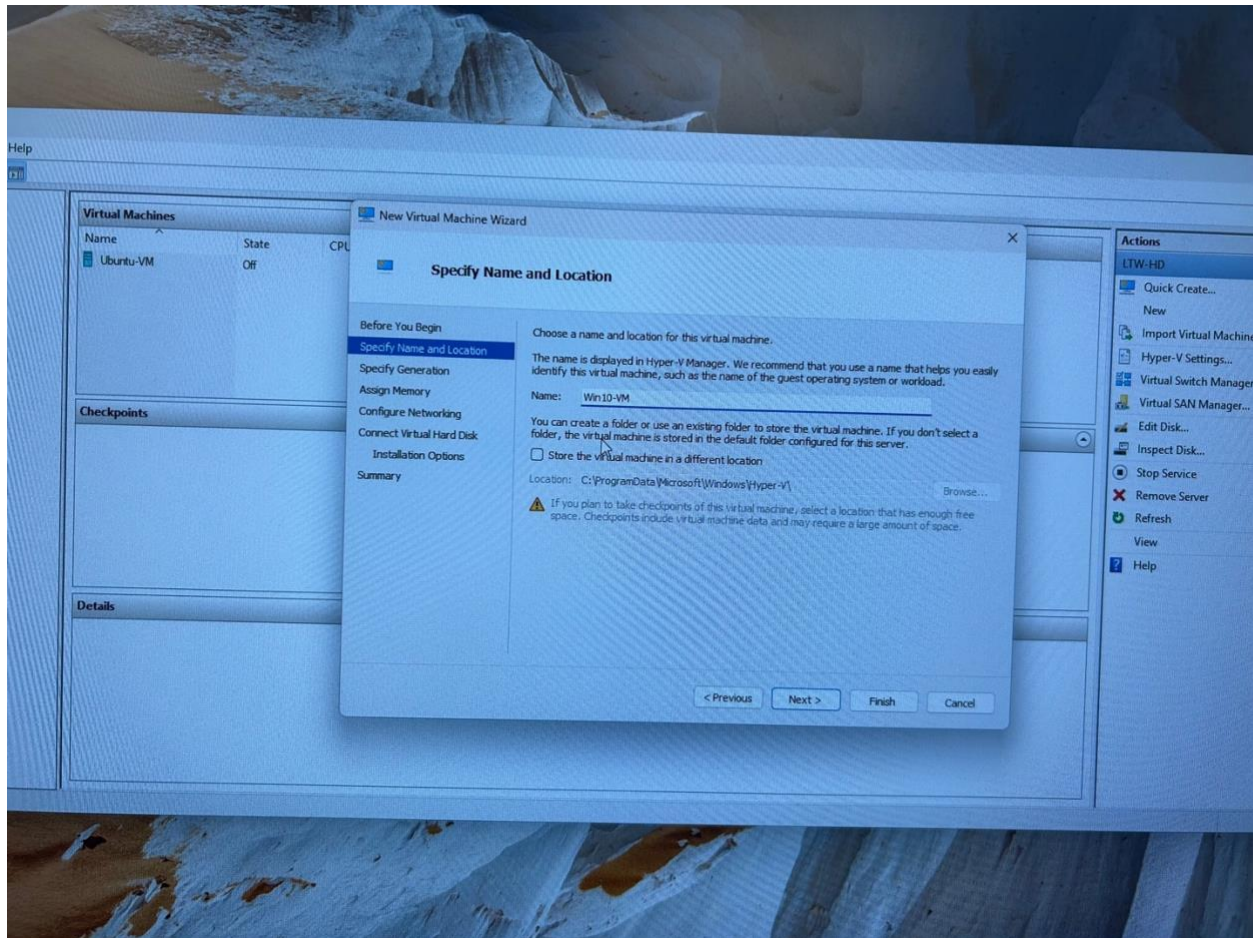

- Open Firefox to access the web

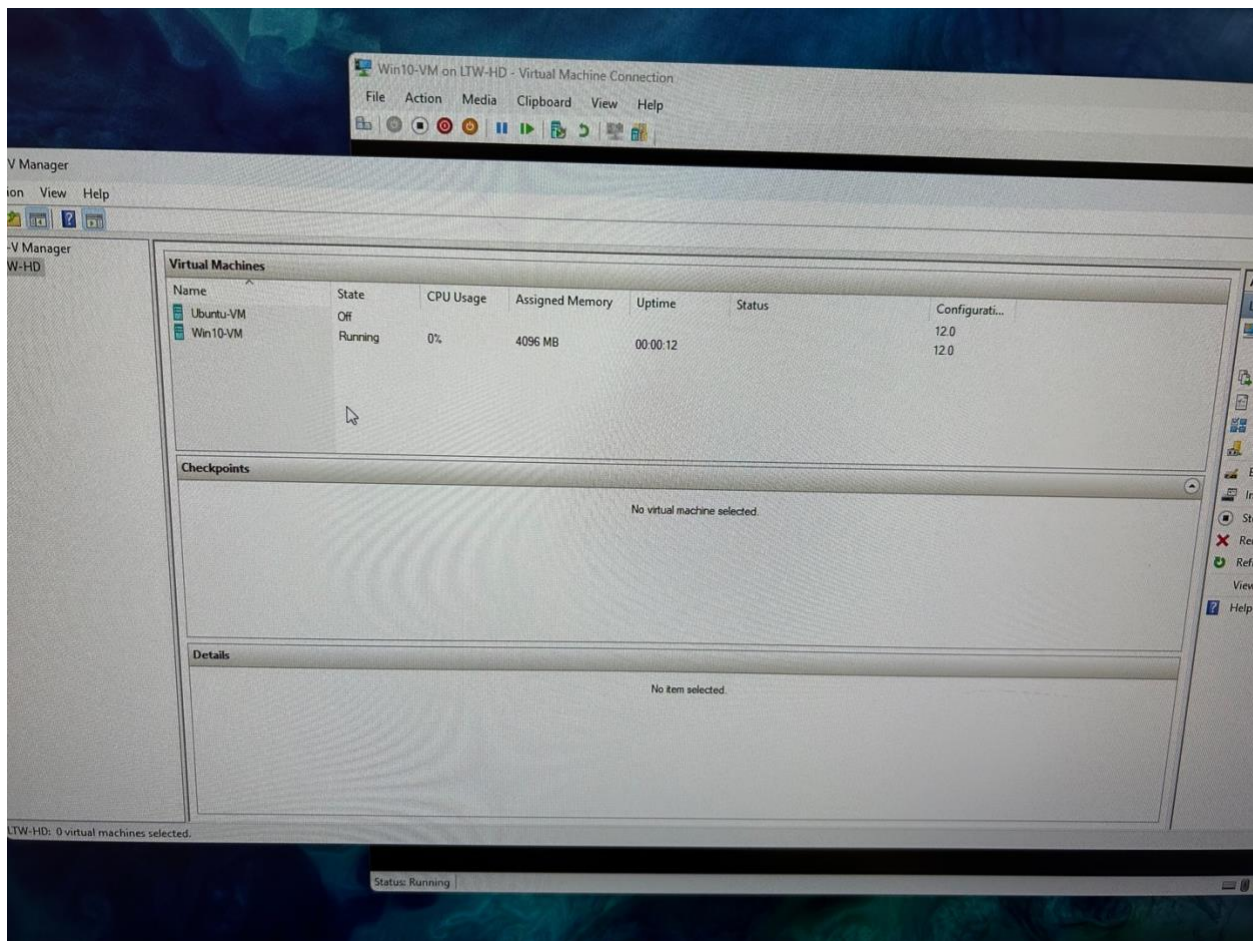

- Accessing Amazon's web domain
- This completes installing the Ubuntu Virtual Machine

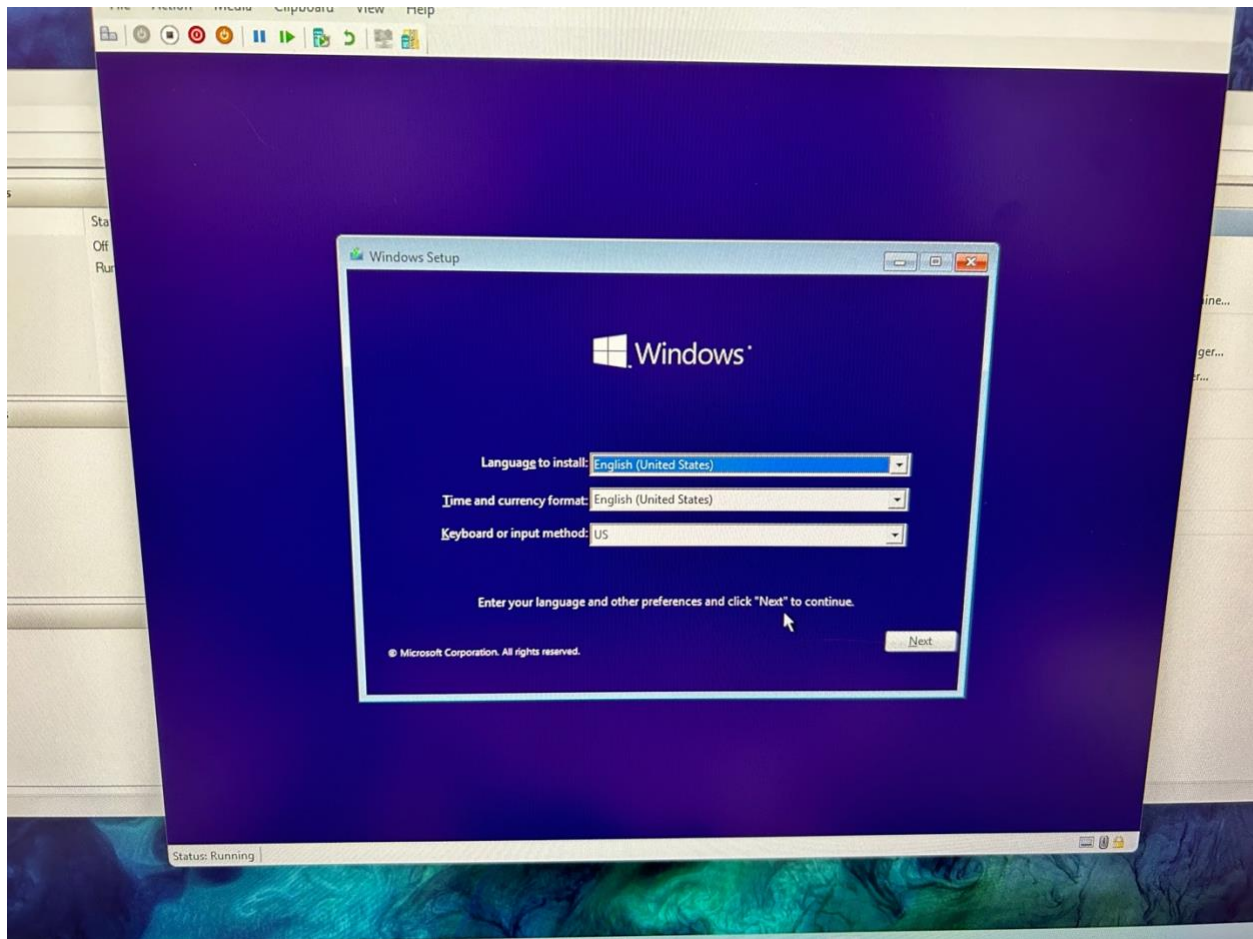

Windows 10-VM with Windows 11

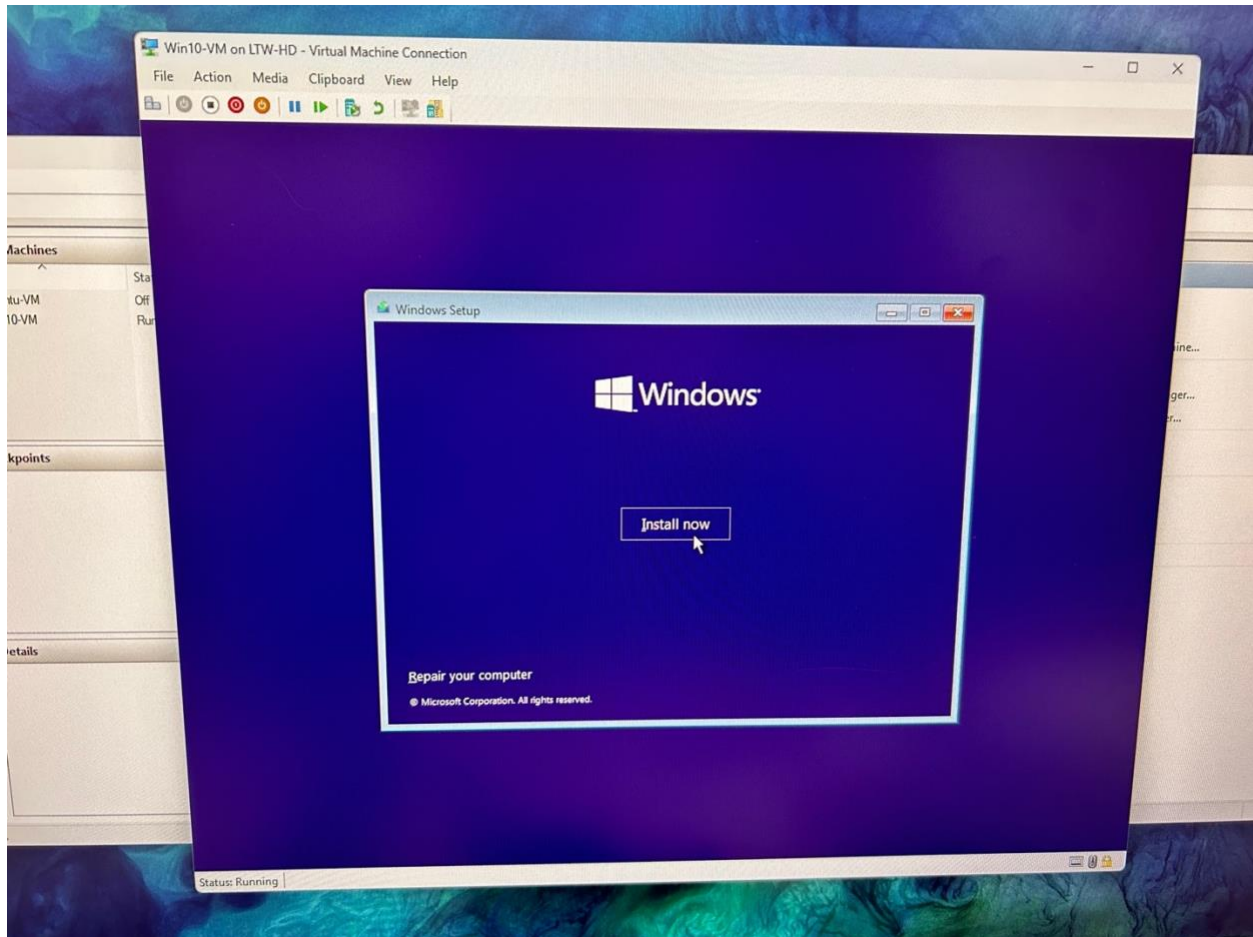

- Open the Hyper-V Manager application. Select “Action-New-Virtual Machine.”
- Name the virtual machine
- Follow the same steps from installing the Ubuntu-VM in the New Virtual Machine Wizard, with the space requirements for Windows 10.

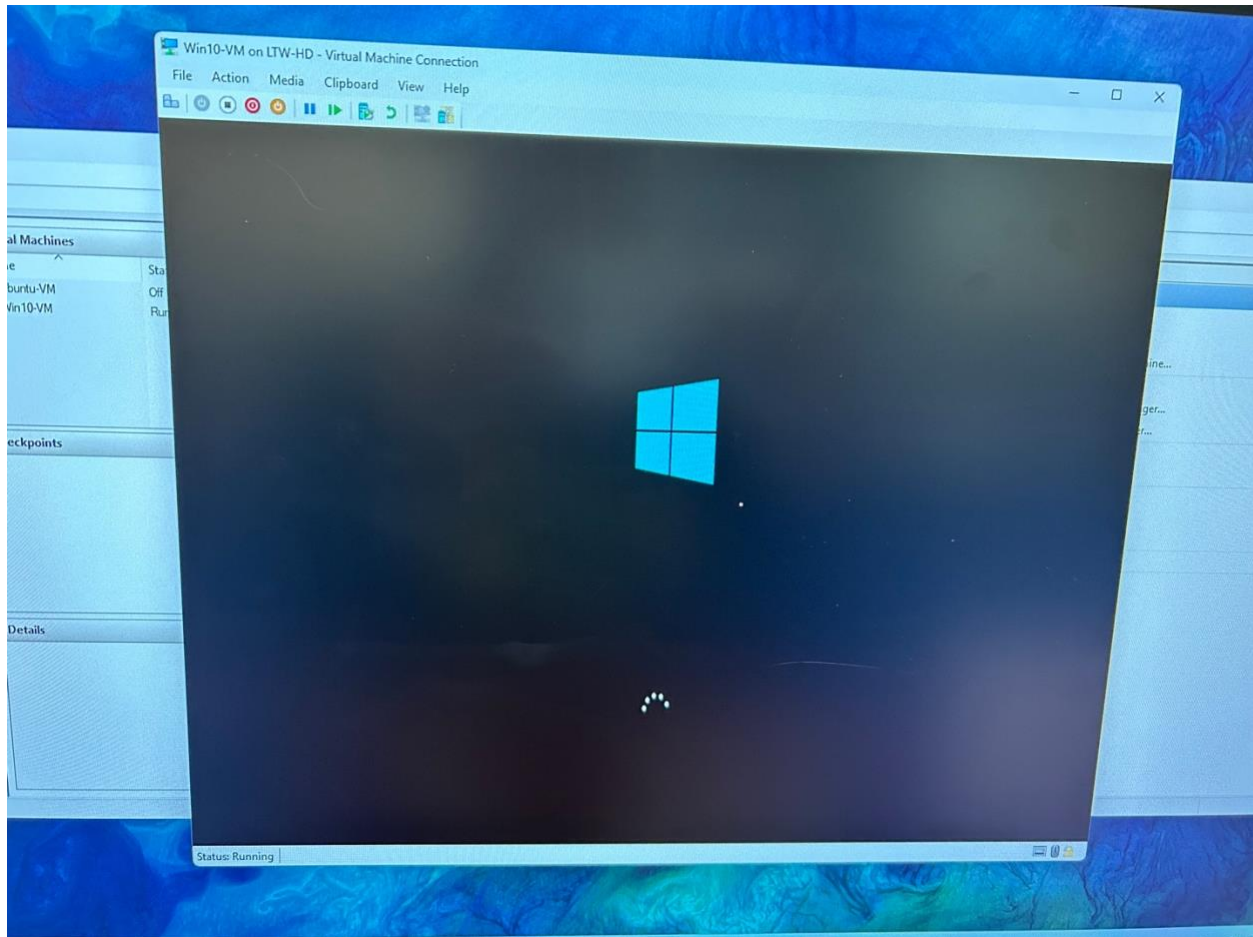

- Right click the VM and select connect

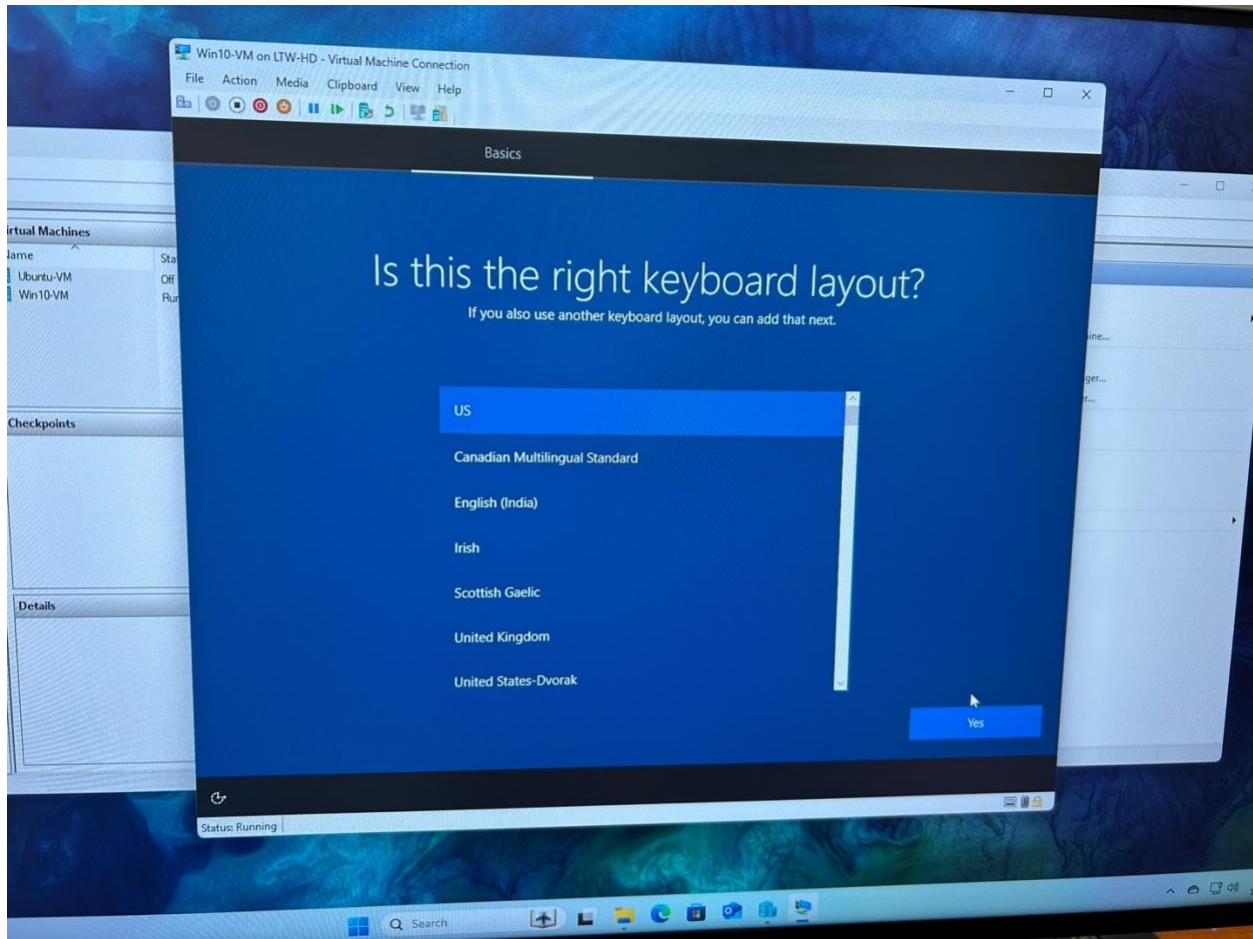

- Windows 10 begins to install
- Select the user preferences

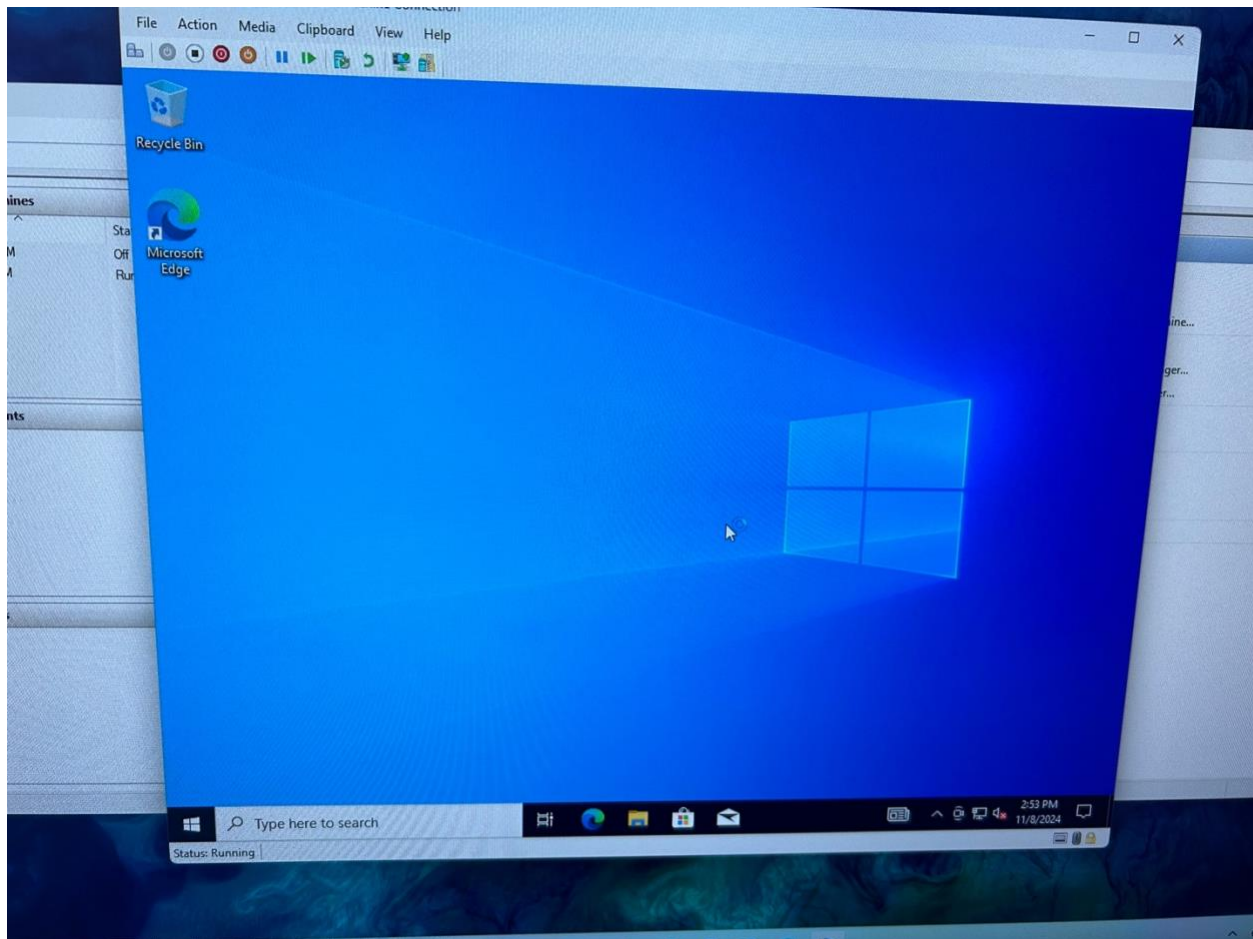

- Select install now

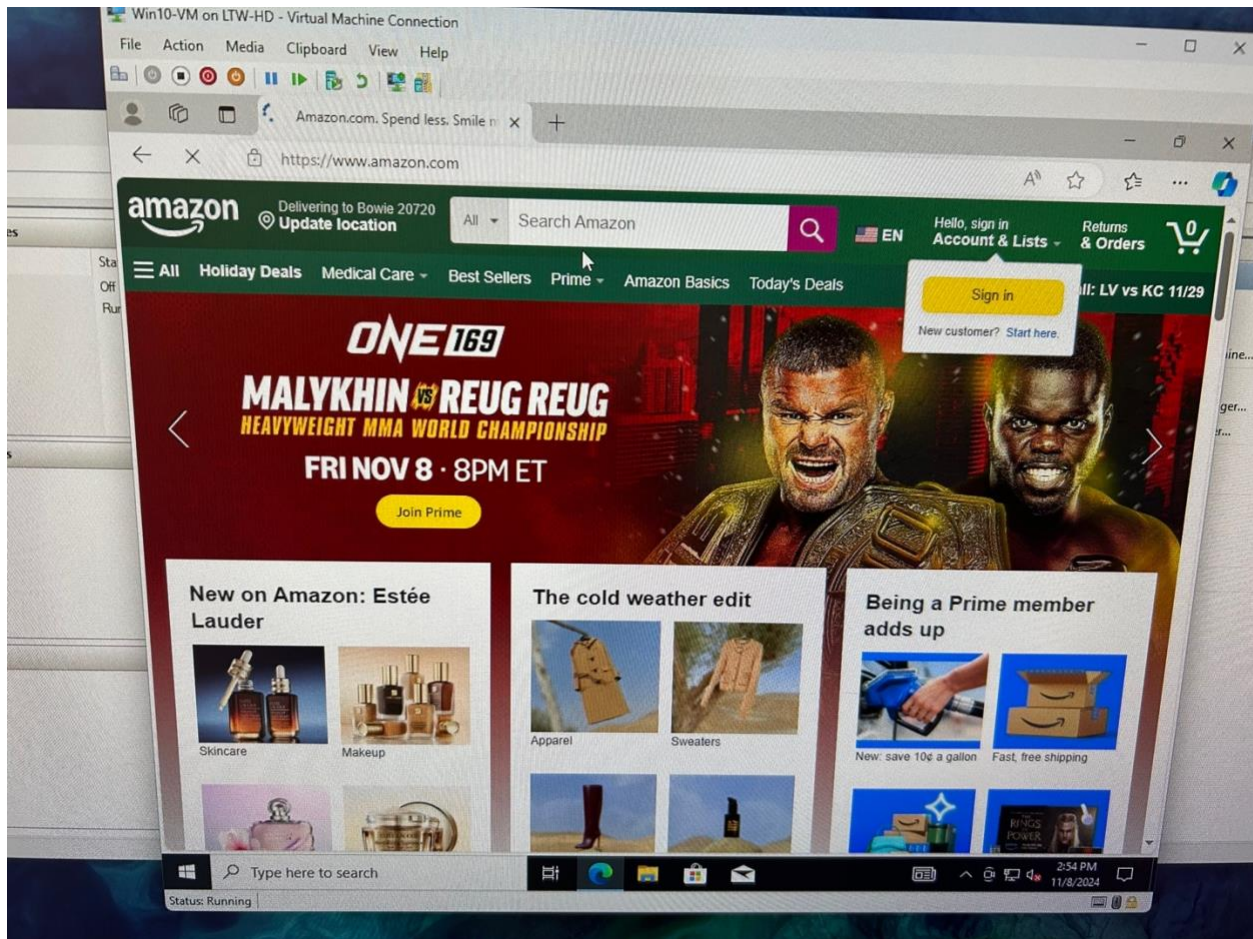

- Windows 10 begins to install

- Windows 10 is installed and proceeds to ask for user preferences and basic requirements

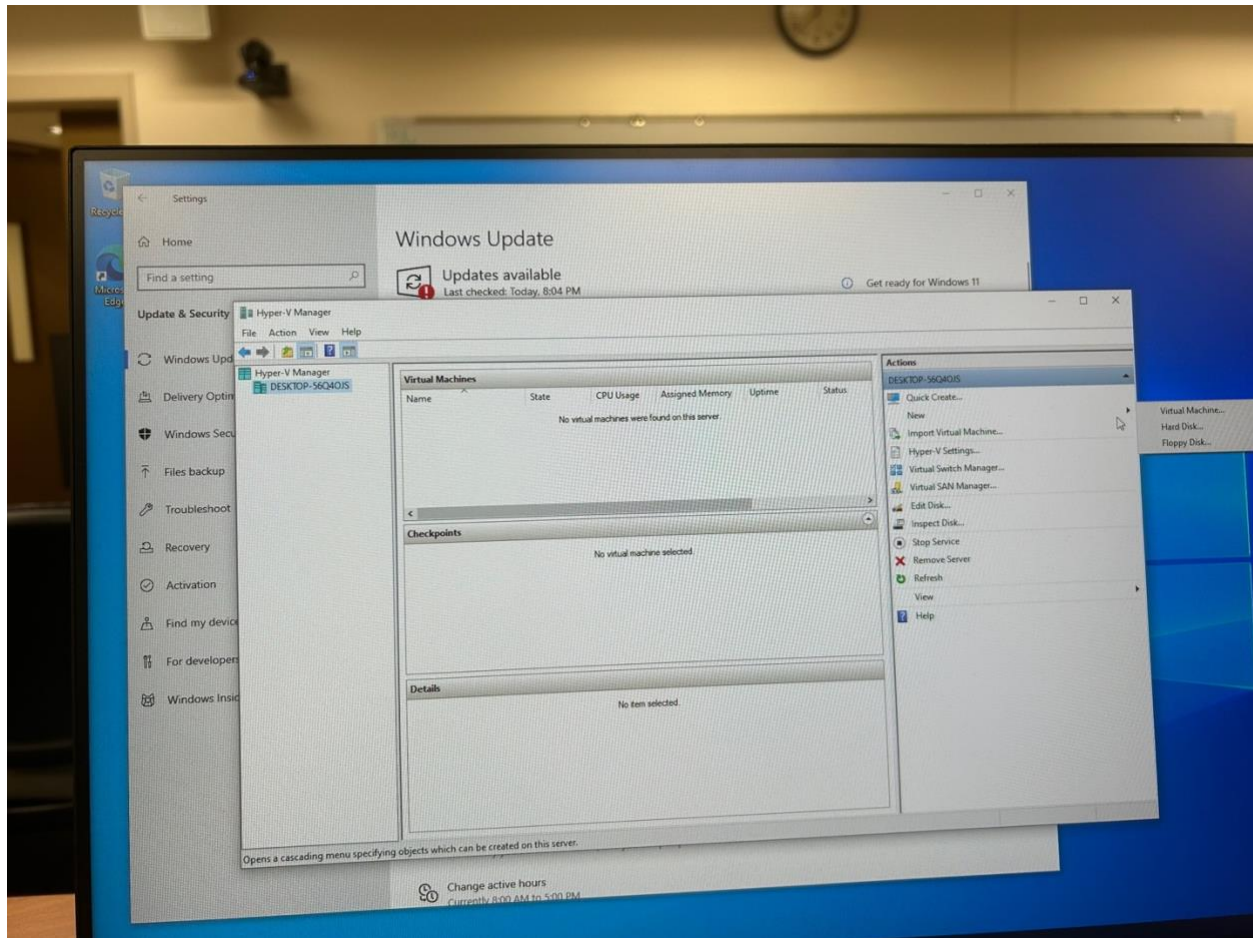

- Windows 10 interface

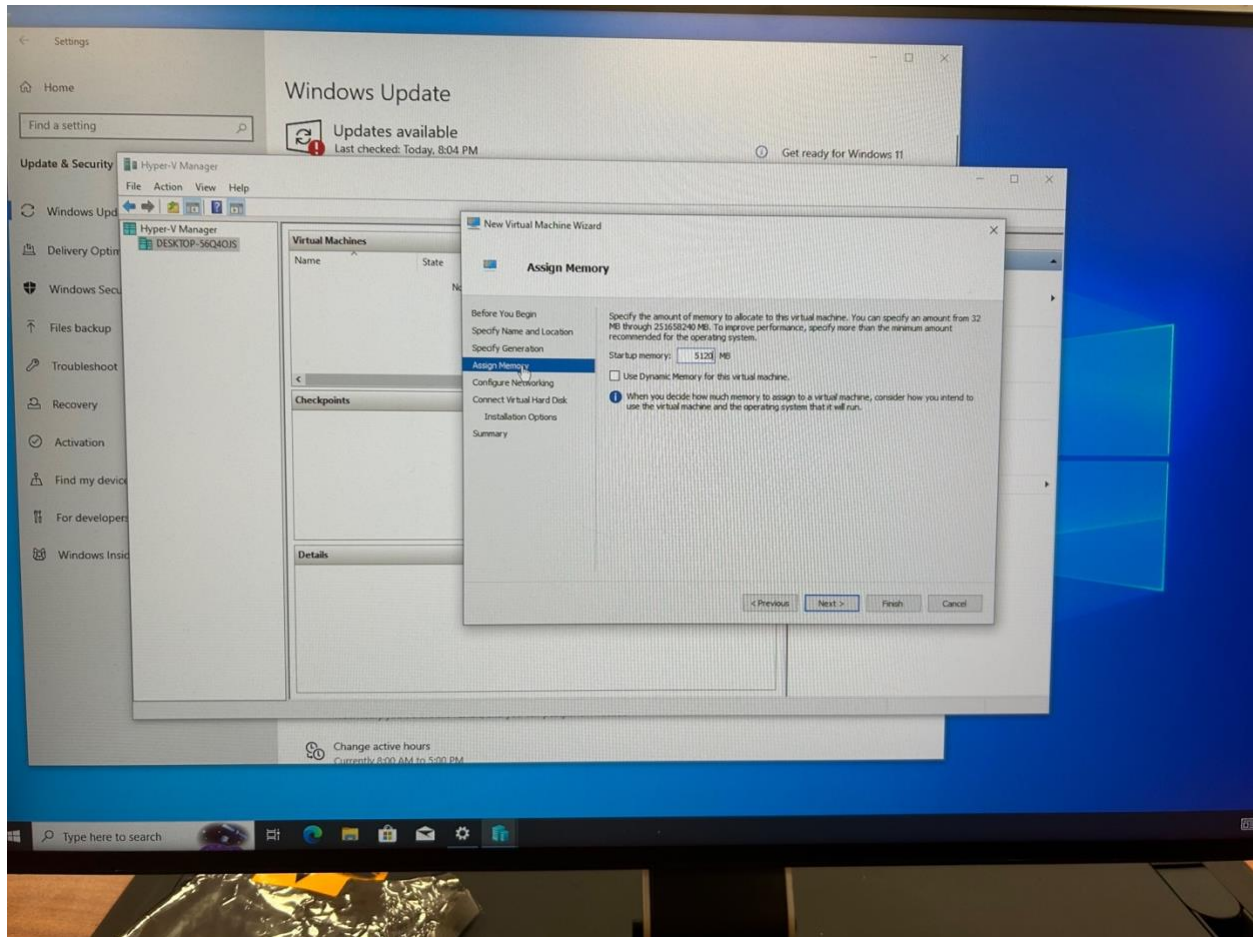

- Open Microsoft Edge and access another web domain other than Bowie State
- In this case, Amazon's domain was chosen
- This completes the installation process for Windows 10-VM

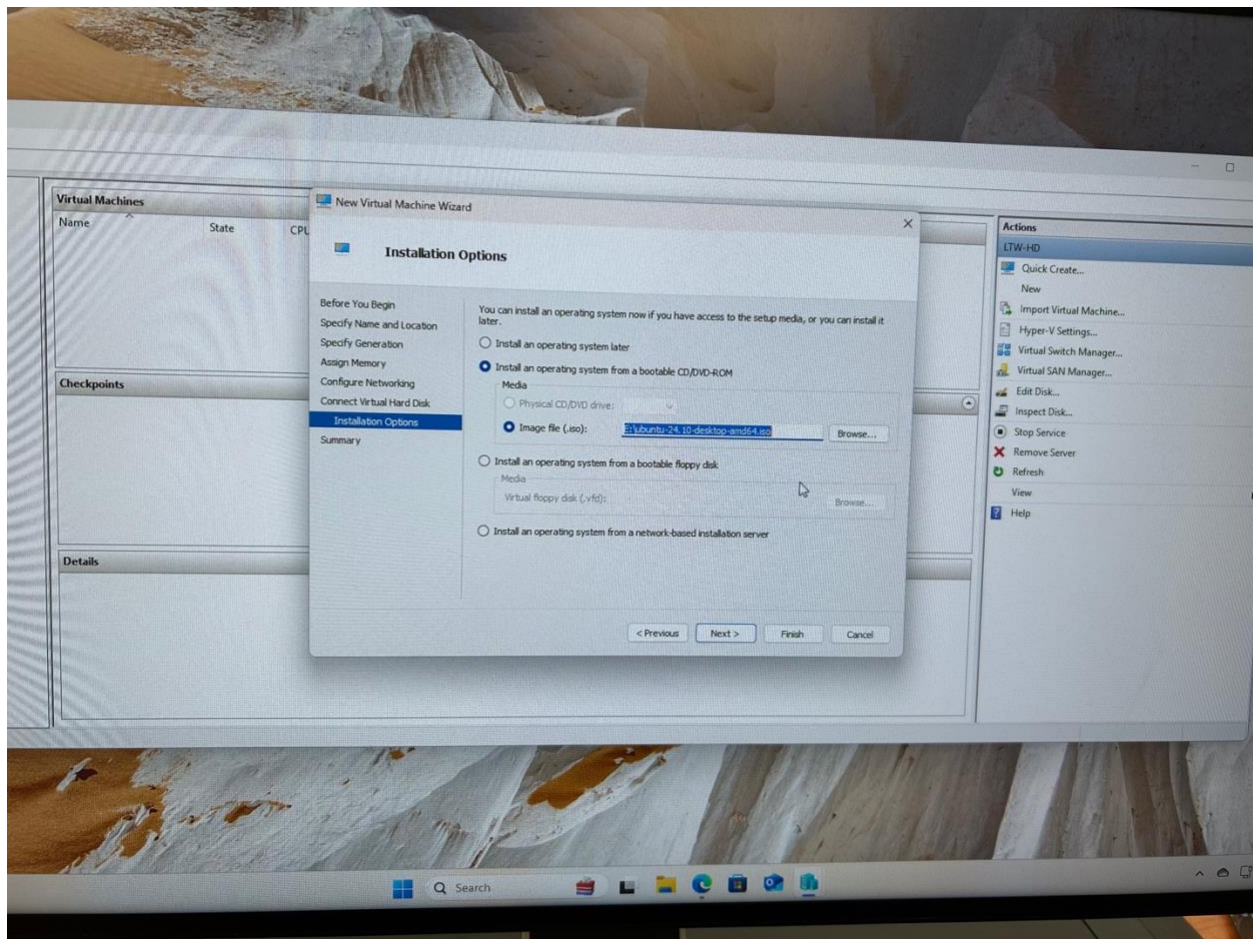

Ubuntu with Windows 10

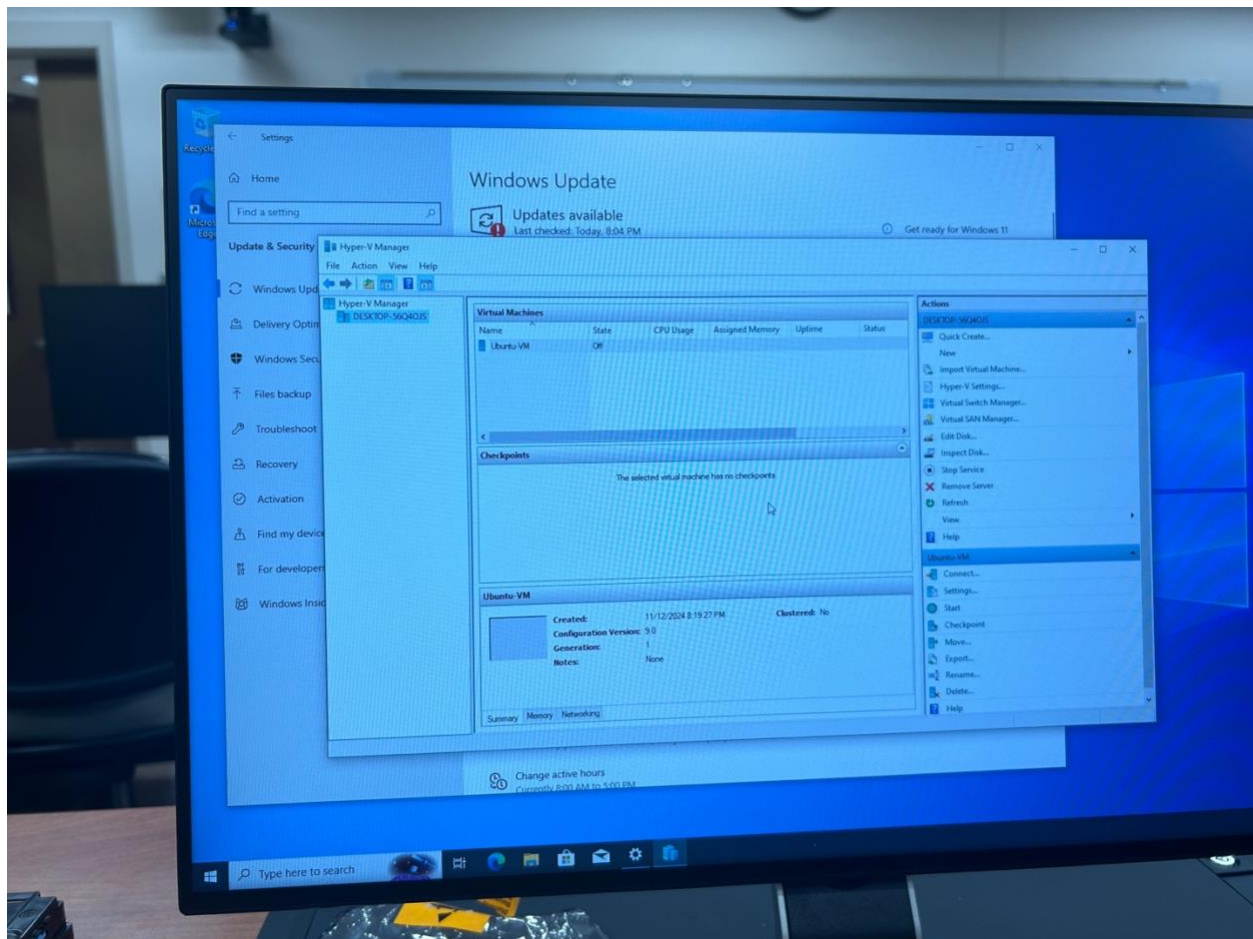

- Open Hyper-V Manager
- Select the computer name
- Select New-VirtualMachine

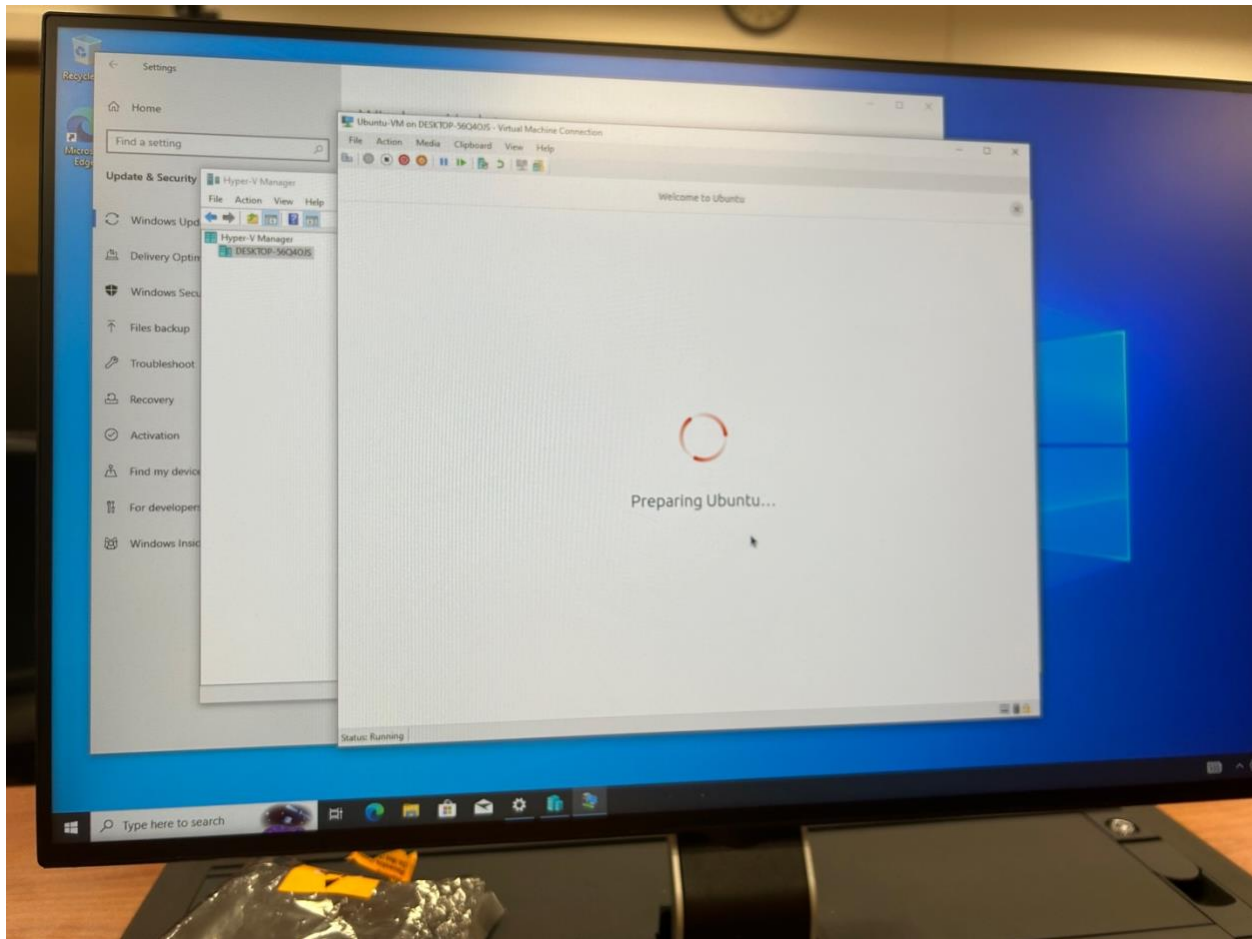

- Name VM and select generation 1
- Then input the required amount of RAM to install the OS.
- Do not select Use dynamic memory

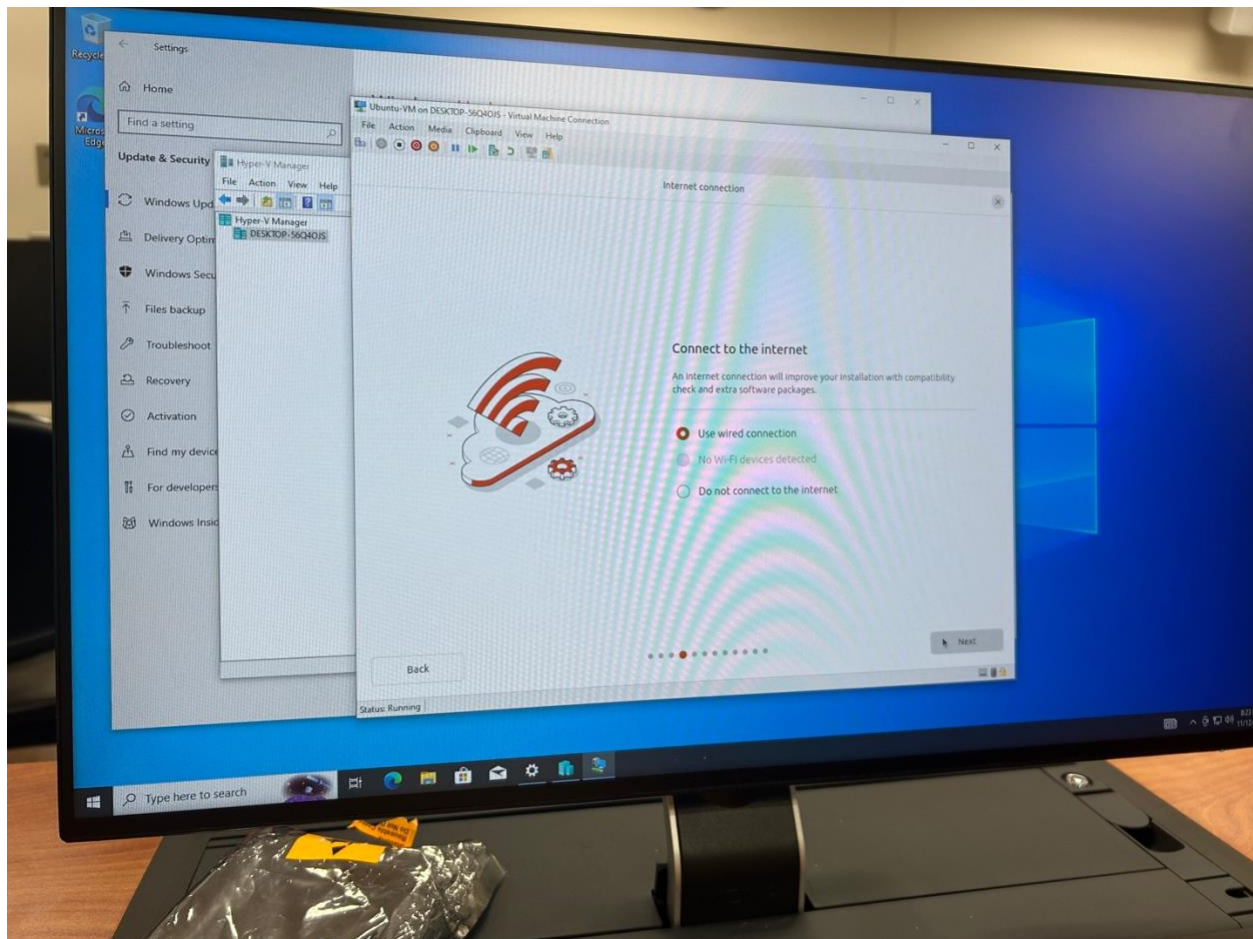

- Your USB should be plugged into the computer
- Select the second option and then Image iso.
- Find the iso file for Ubuntu
- Select next and then finish

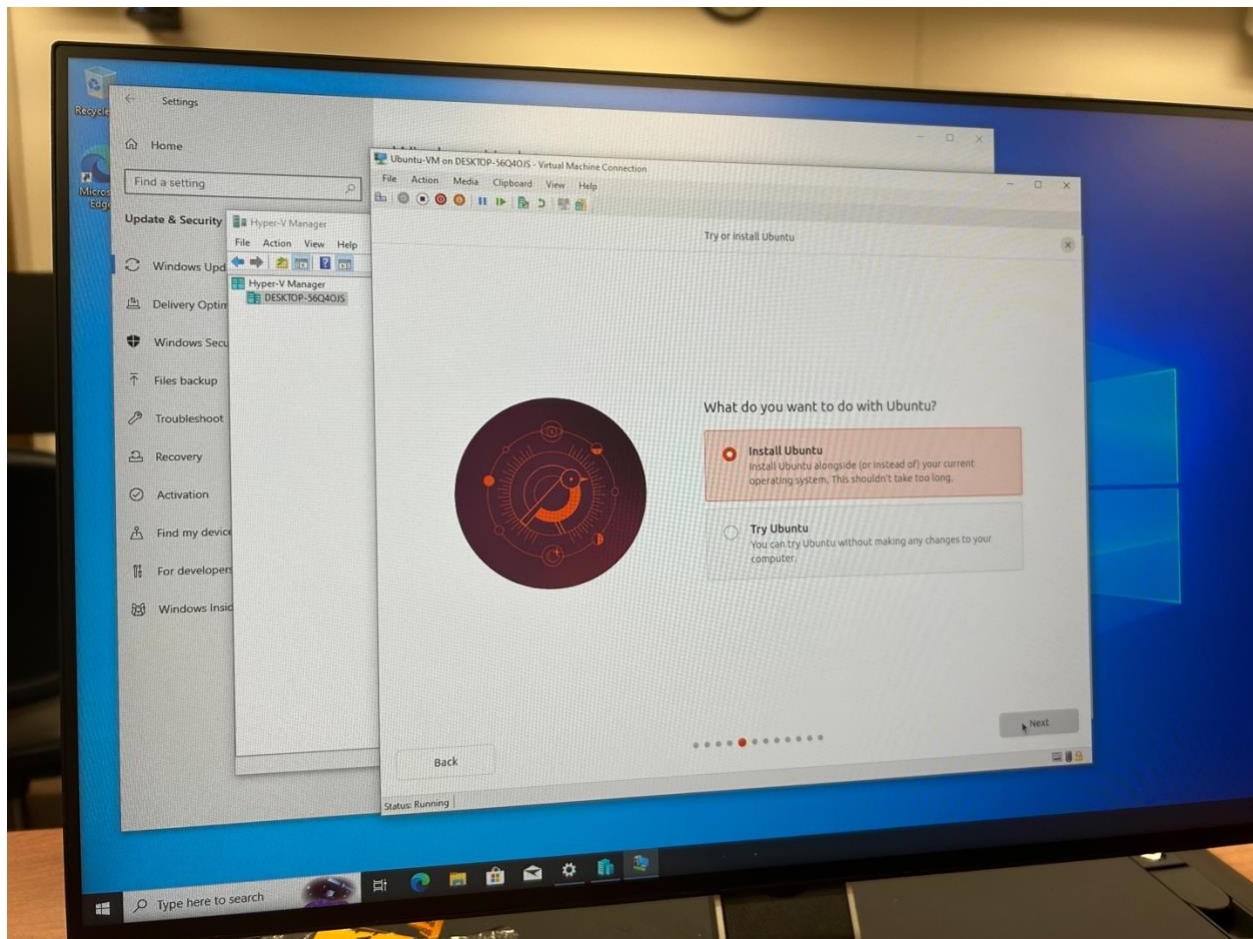

- Double click the VM to start it

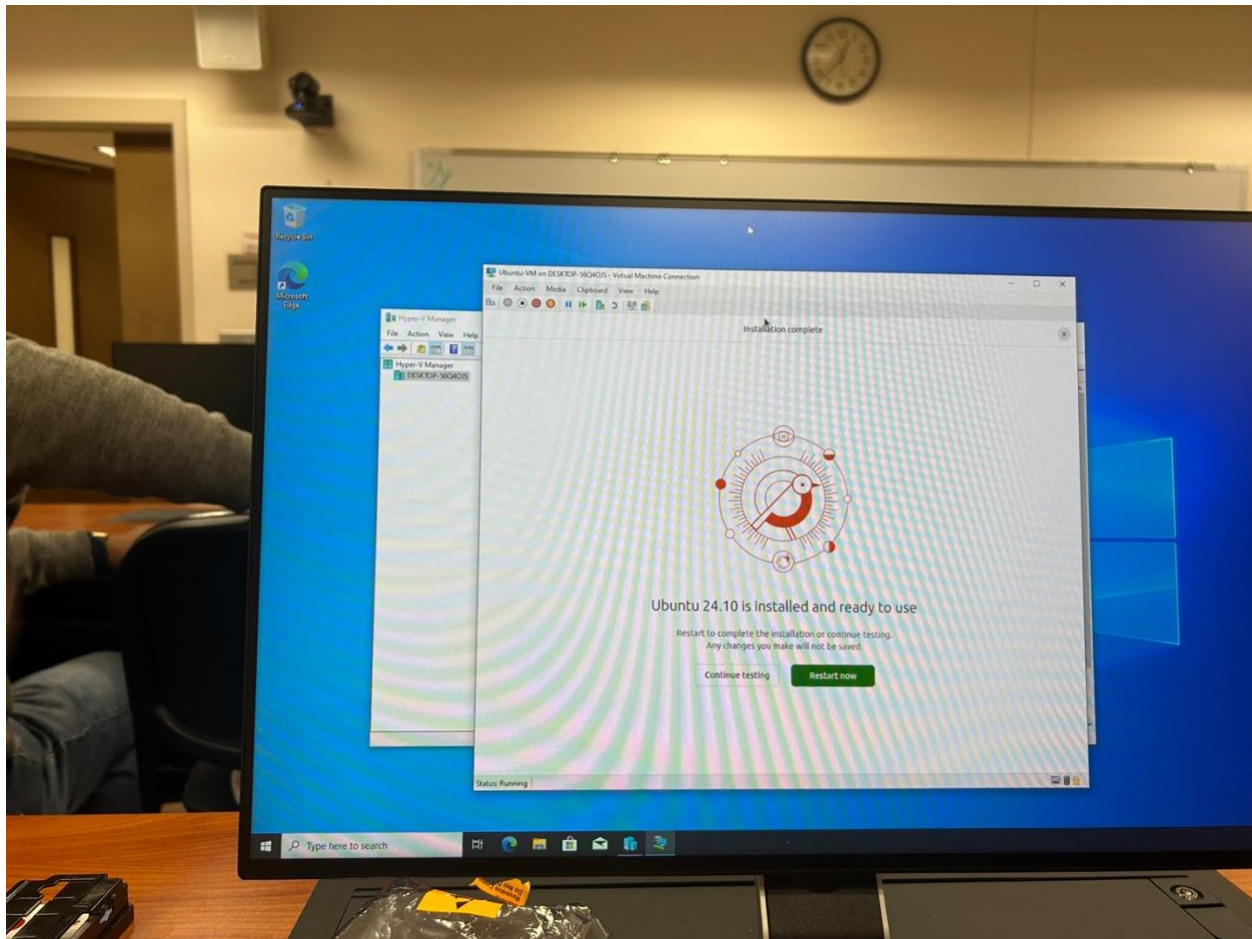

- The VM will load and start to begin the installation process.

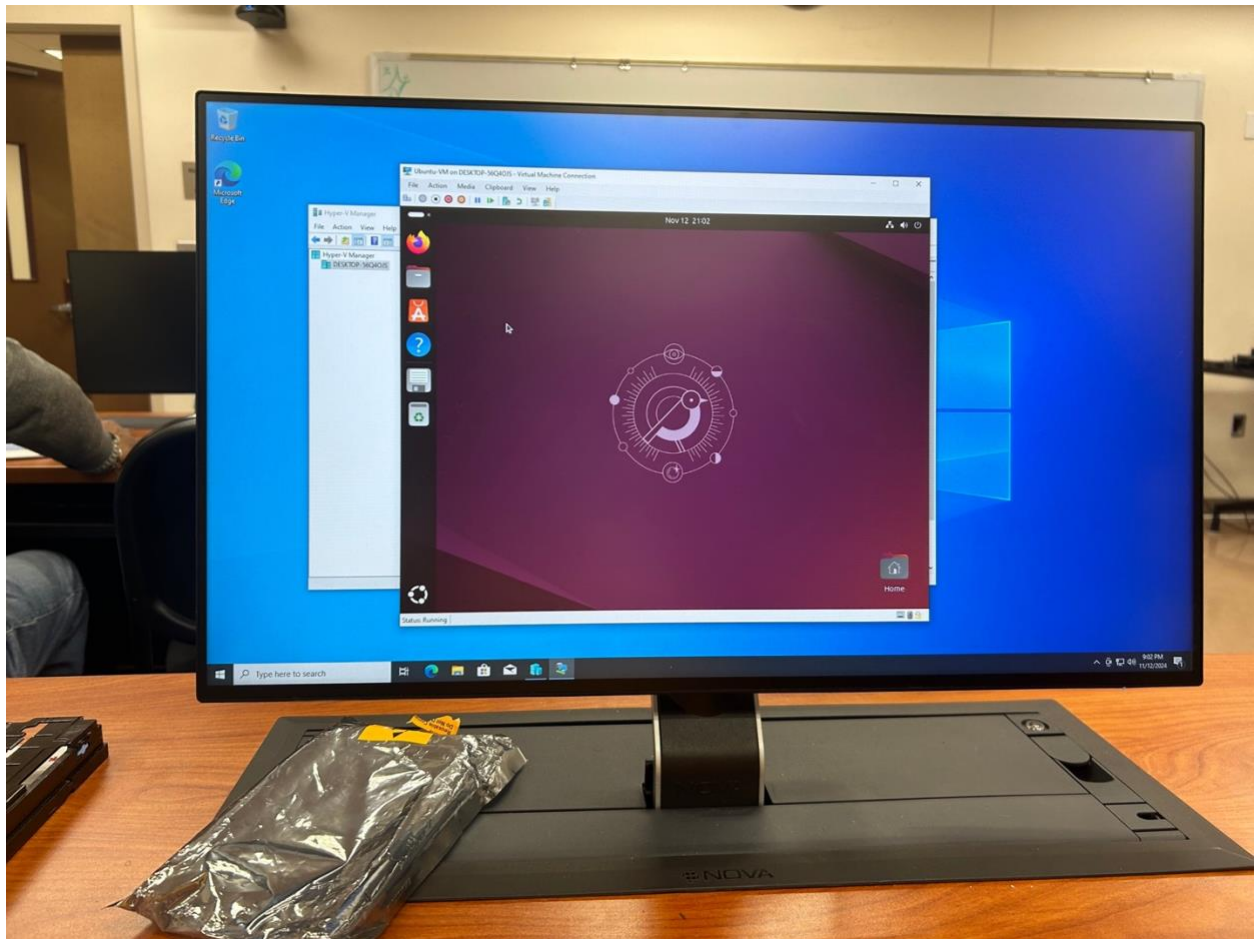

- Select Use wired connection for internet access

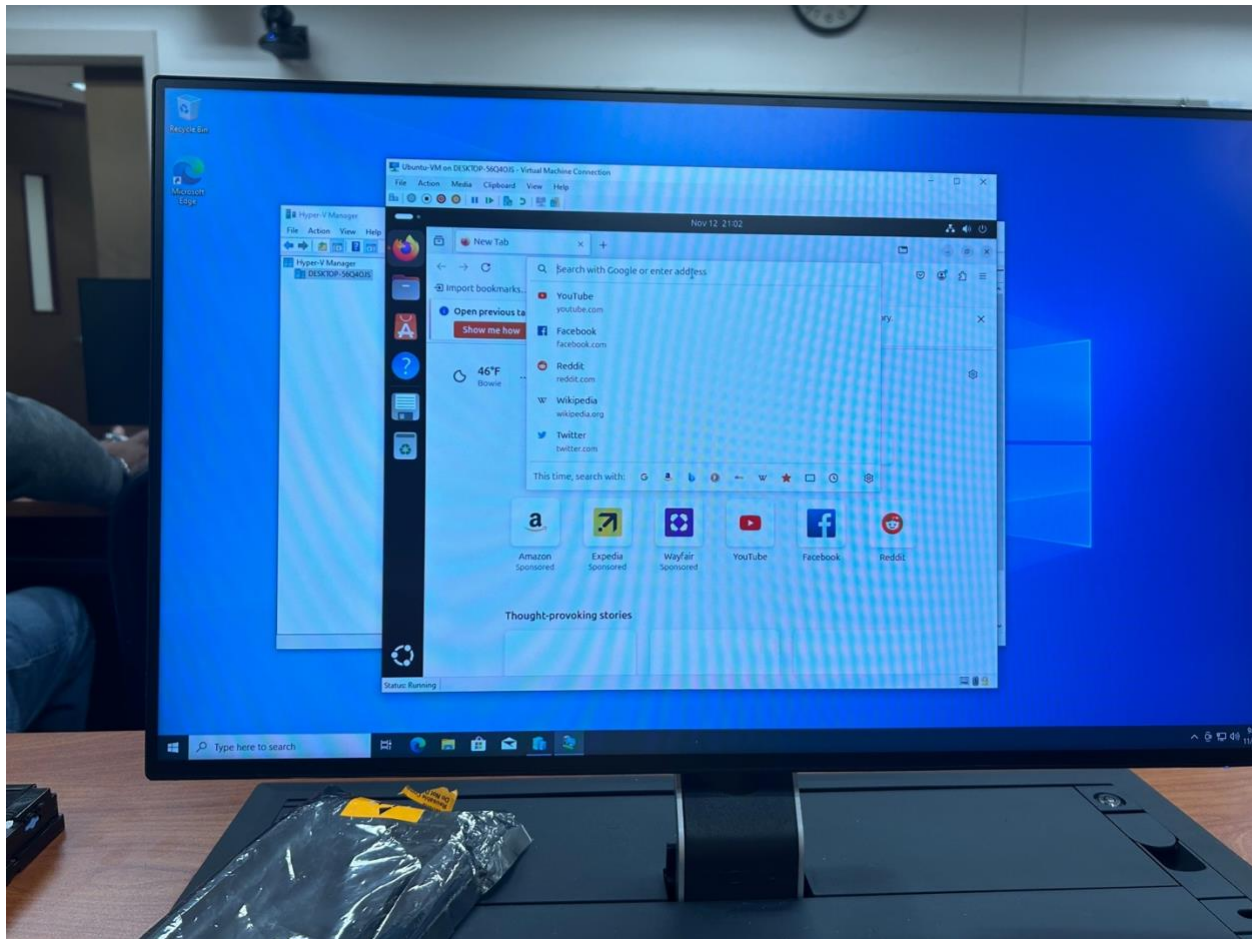

- Then select install Ubuntu

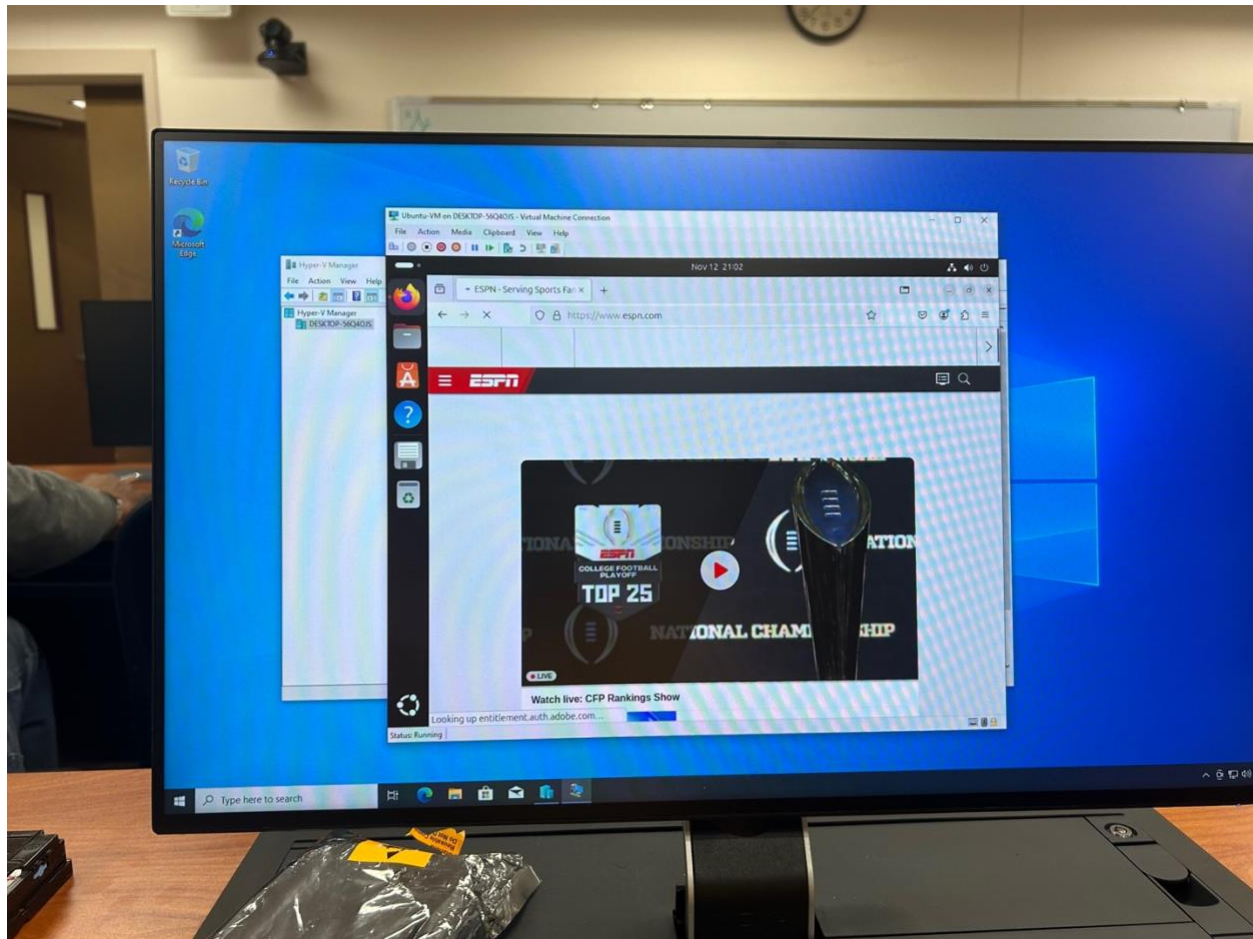

- Select the restart now button to proceed with installing Ubuntu VM

- The Ubuntu 24 interface

- Open Firefox to access the web

- Navigate to ESPN or another web service that is a Non Bowiestate.edu server.
- This completes the lab.
