Lab 2 - Operating System Dual Boot Documentation

Operating System: Windows 10

Creating a Windows 10 bootable with Rufus 4.5.2180 that was installed on a 128GB USB Flash Drive.

Once inserting the 1TB Internal hard drive and USB flash drive, I clicked the key F12 rapidly until the BIOS settings appeared. Ensured that secure boot was on.

Under UEFI BOOT select the USB flash drive that contains the Windows 10 bootable. In this case, my USB was named UEFI: VendorC ProductCode 3.00.

Windows 10 start up process will begin. Starting with selecting a language.

Certain requirements for the install include:
Selecting "I do not have product key."

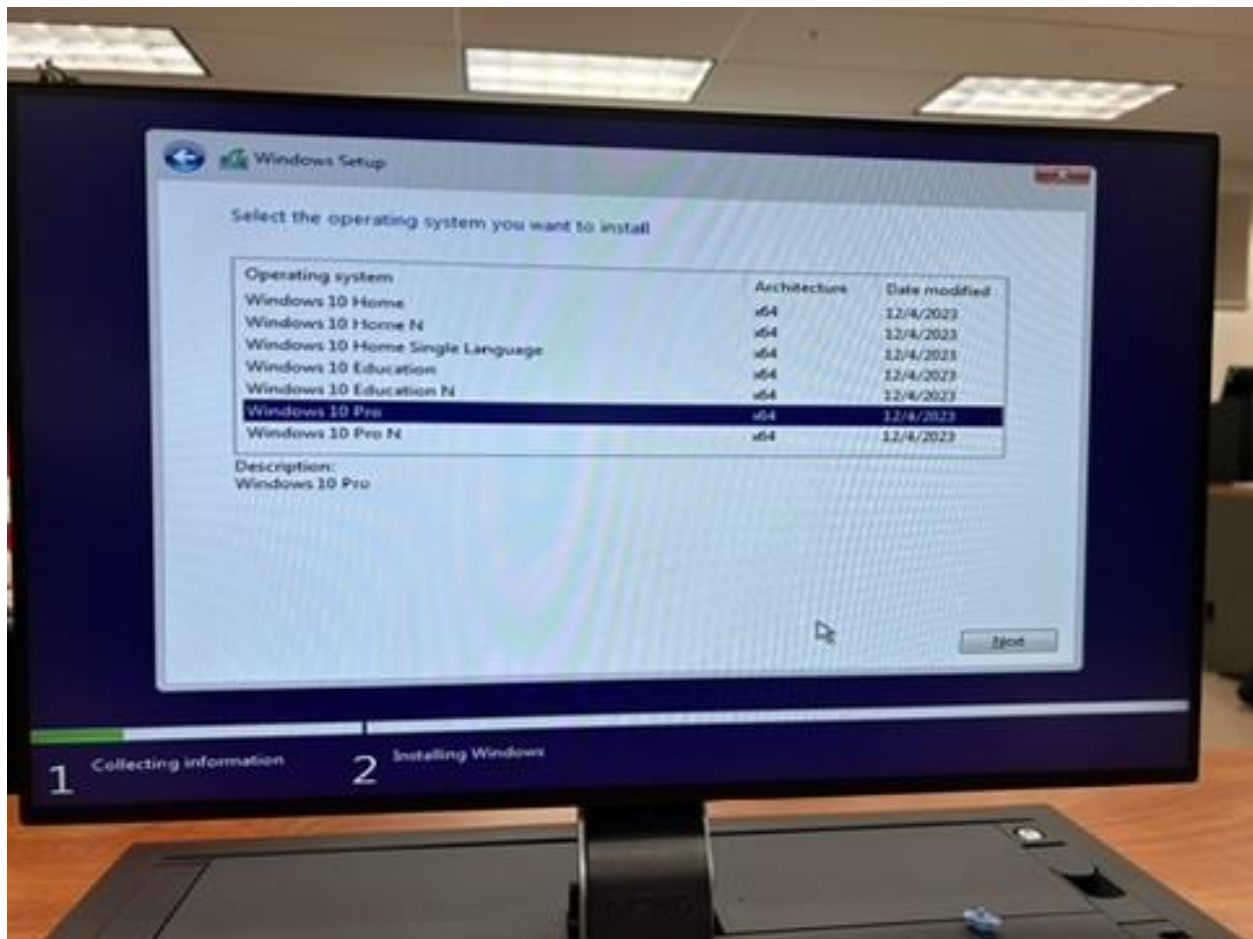

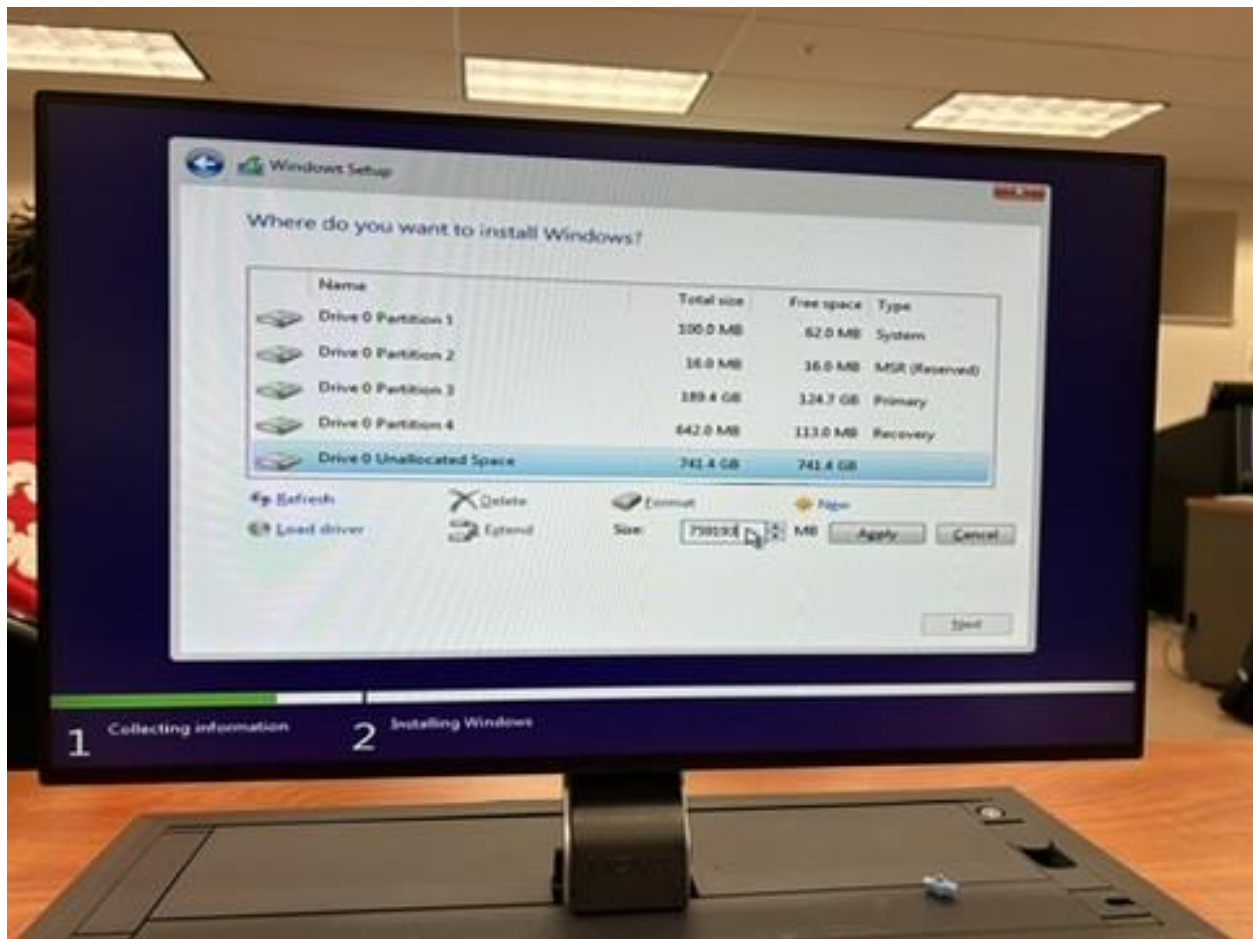

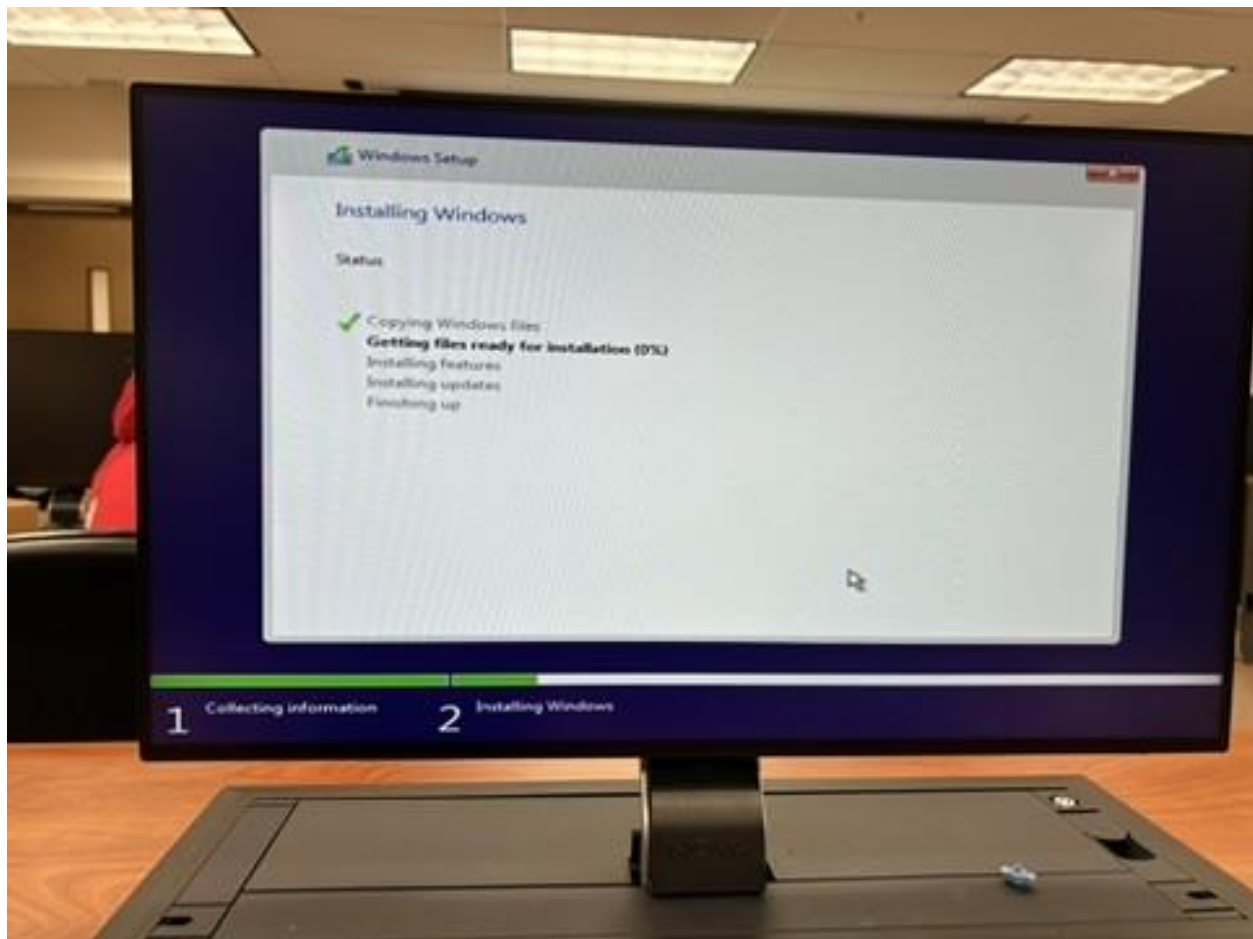

Image Selection: "Windows 10 Pro"
Then select "install Windows 10."

The next step is to partition the Hard Drive. In this case my hard drive is on “Disk 0 Unallocated Space.” The partition size I selected was 80GB but when creating a partition it must be in MB. The conversion was $80\text{GB} \times 1024 = 81,920\text{MB}$ saved to disk 0.

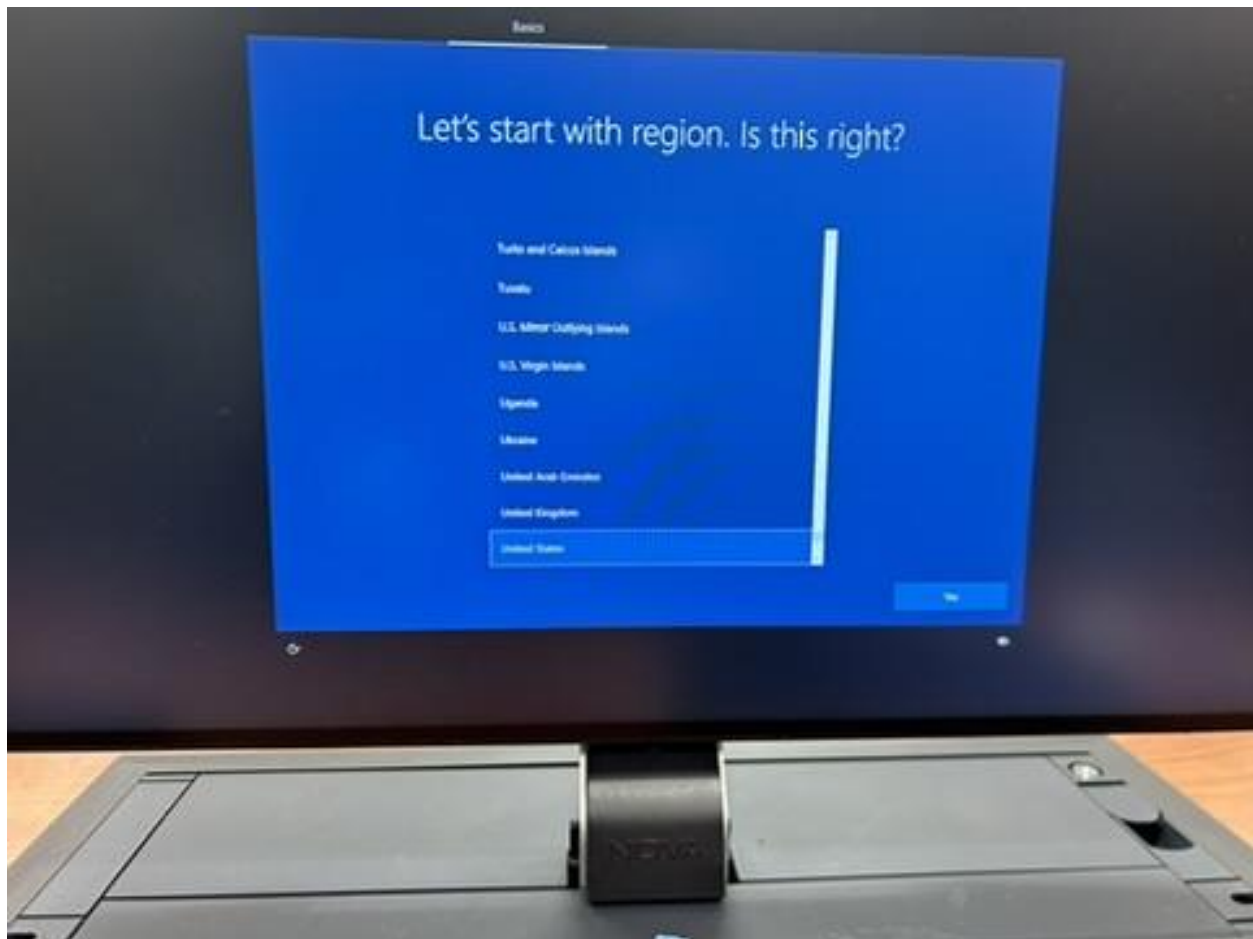

Installation process of Windows 10 begins.

Windows 10 is getting ready to start.

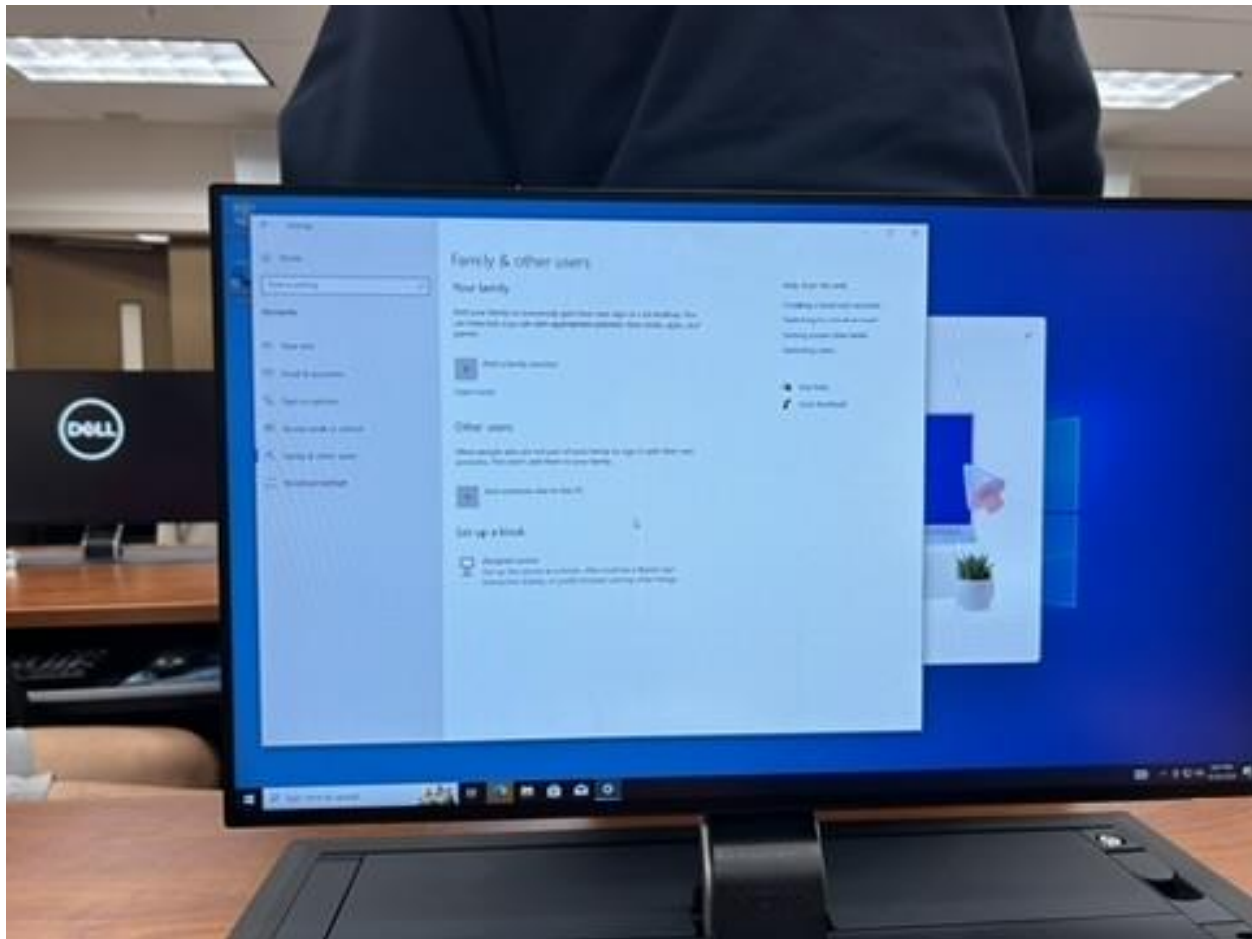

Since, there are two operating systems installed on the hard drive the computer will prompt the user to select between Windows 10 and Windows 11. Select Windows 10.

Select the basic requirements that fit your circumstances as the prompts continue.

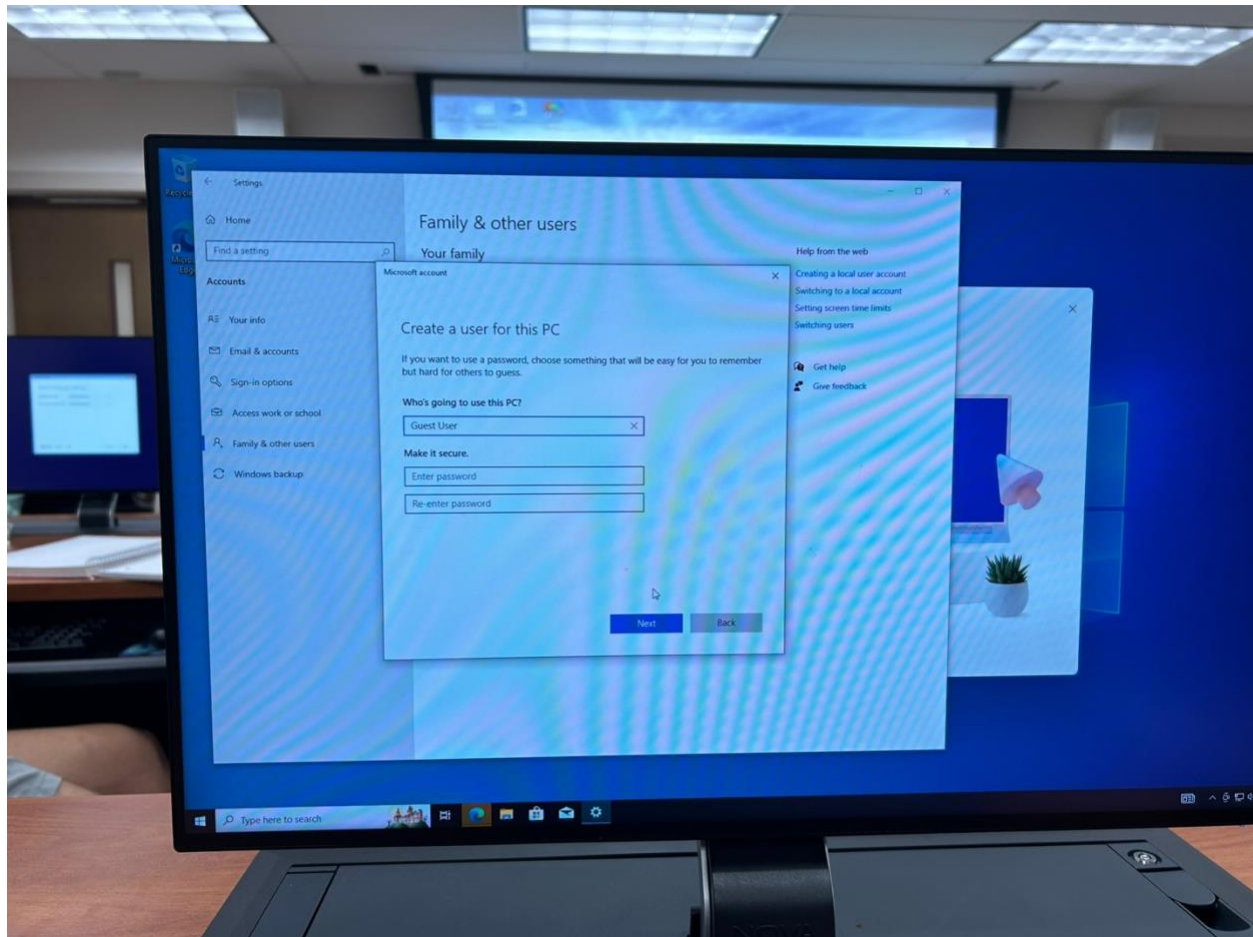

Once the user completes the basic system prompts, the Windows 10 interface will show.

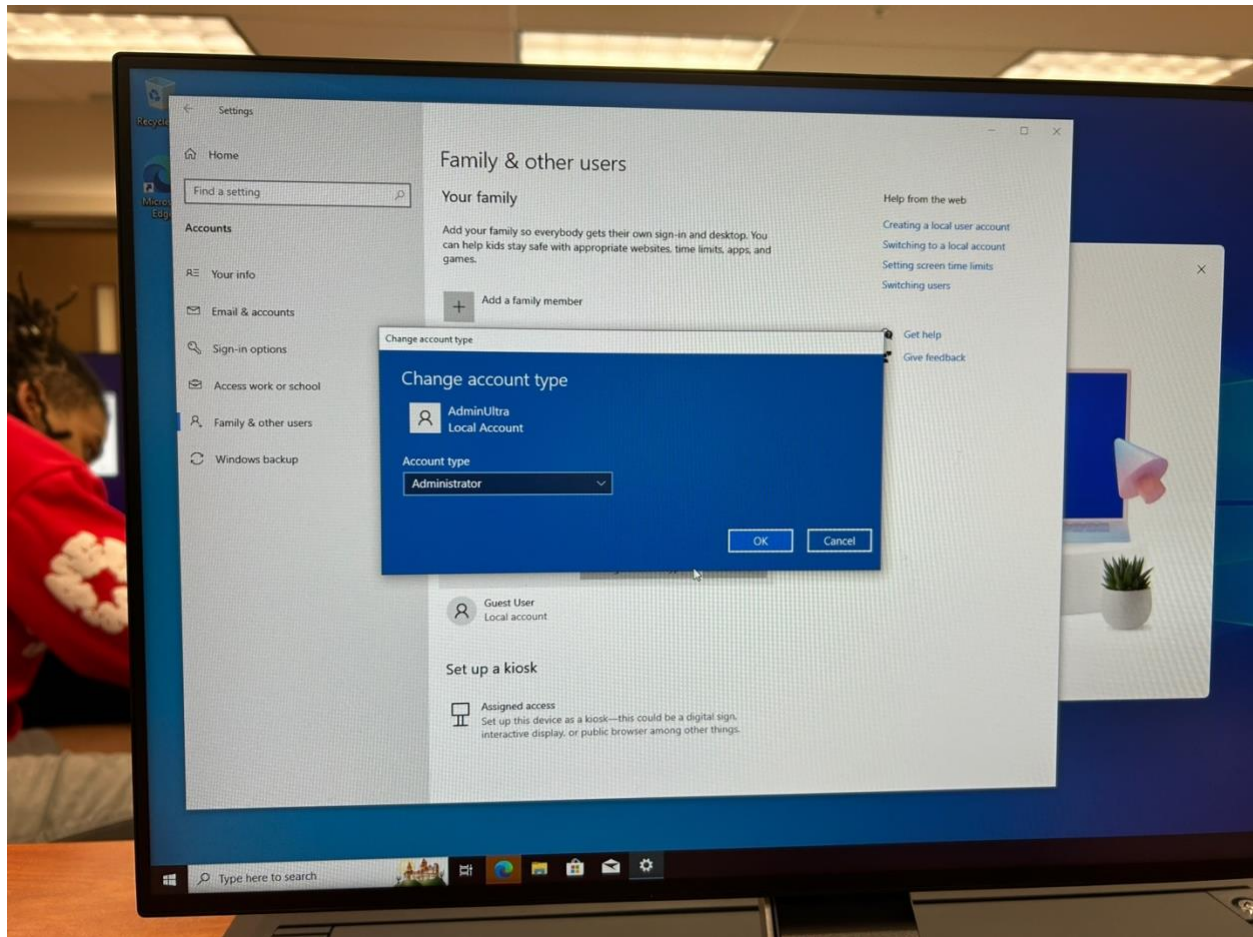

Creating two additional users in Windows 10 (another admin account, and a guest account(local)).

Select “add someone else to this PC”

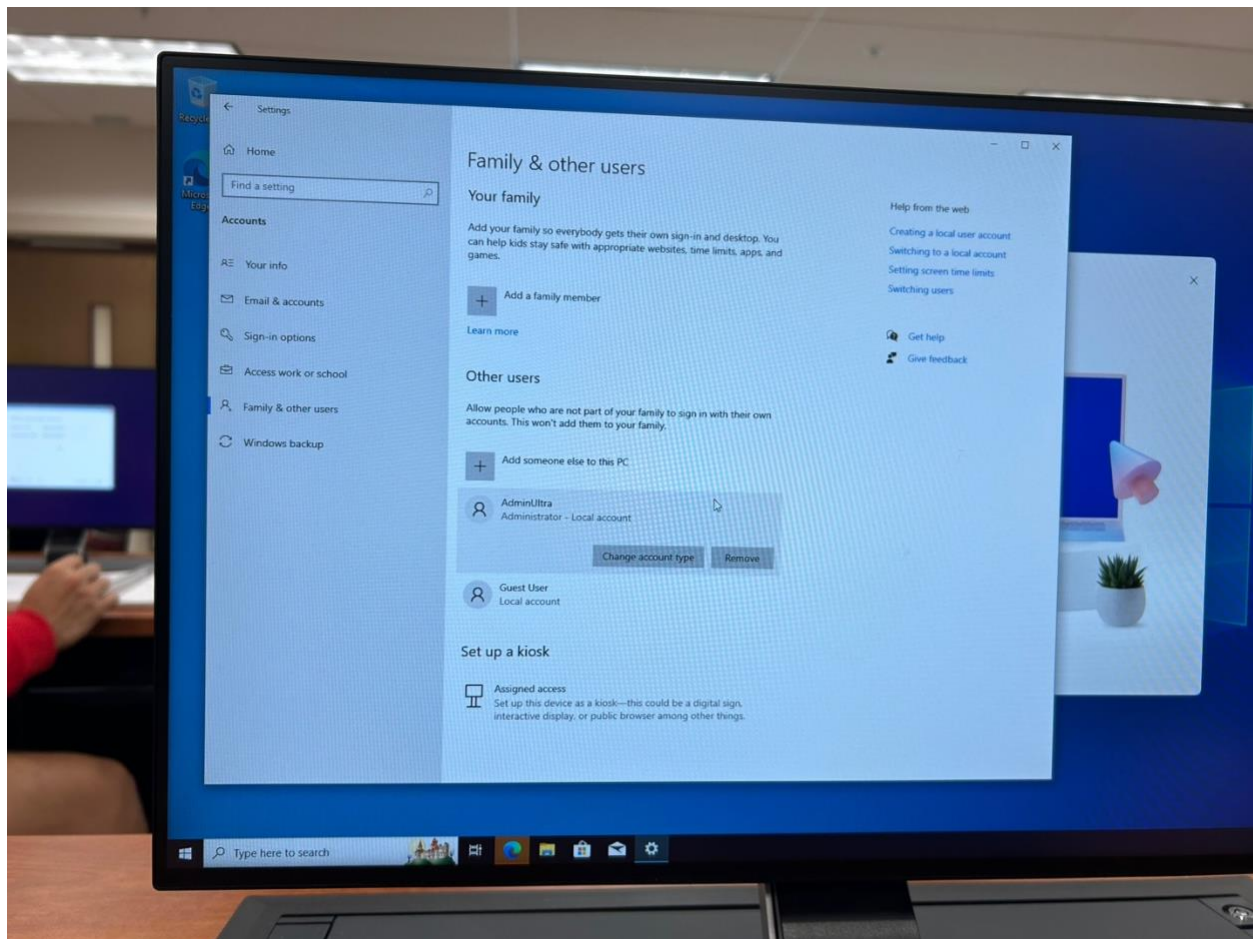

Enter usernames for the admin and guest user accounts.

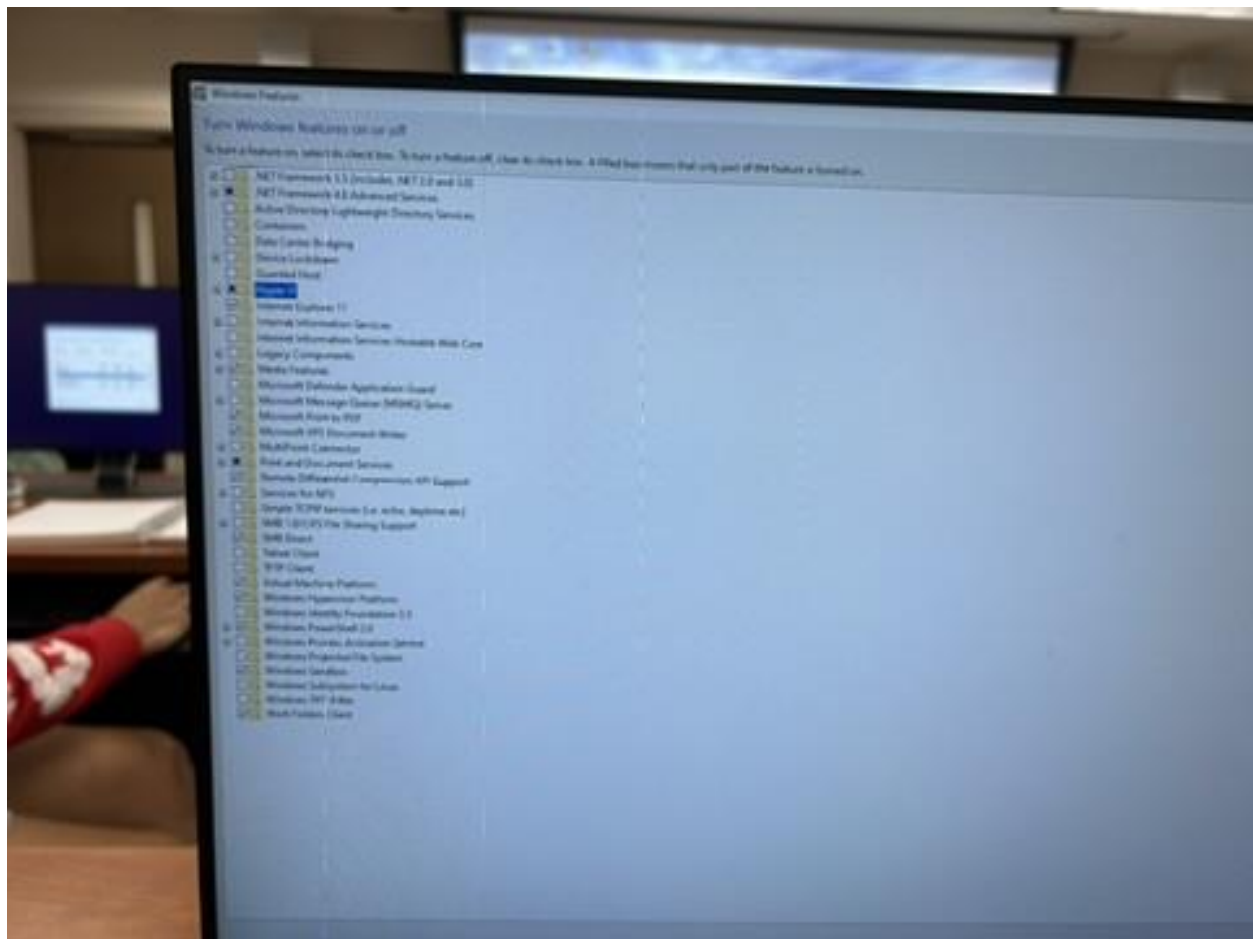

Once accounts are created, select the admin account and change it from a local account to an administrator account.

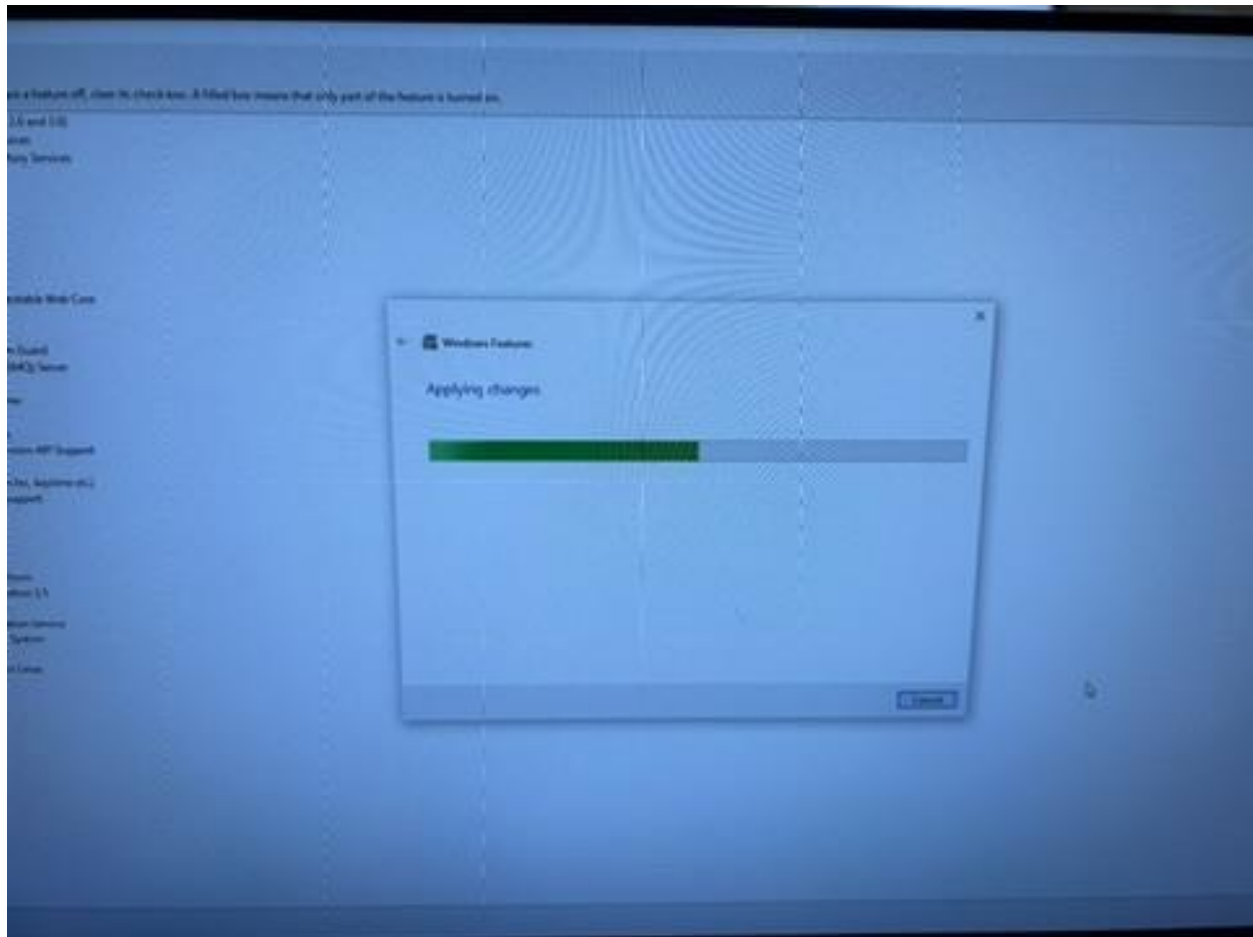

Keep the guest user account as a local account.

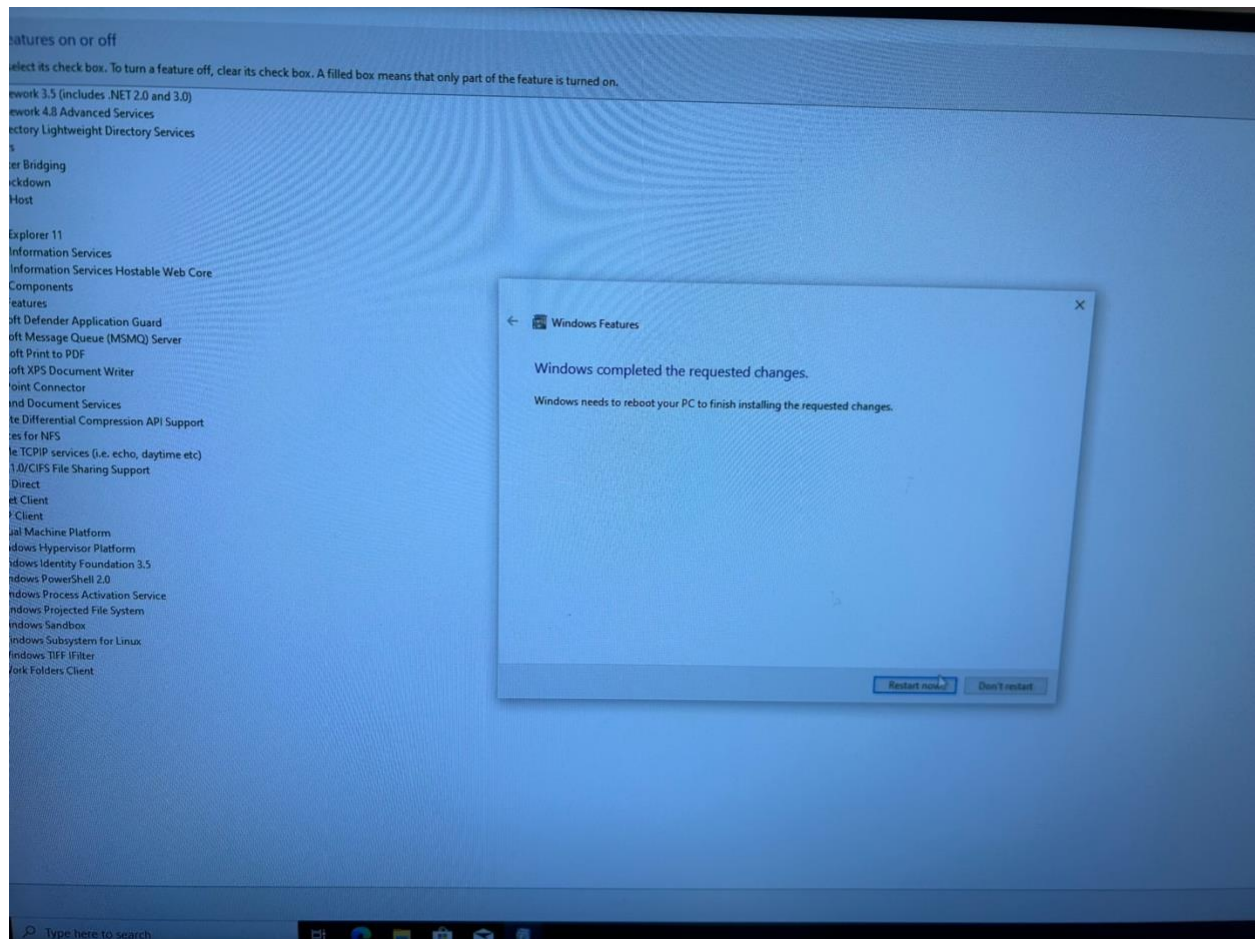

A final look of the accounts created.

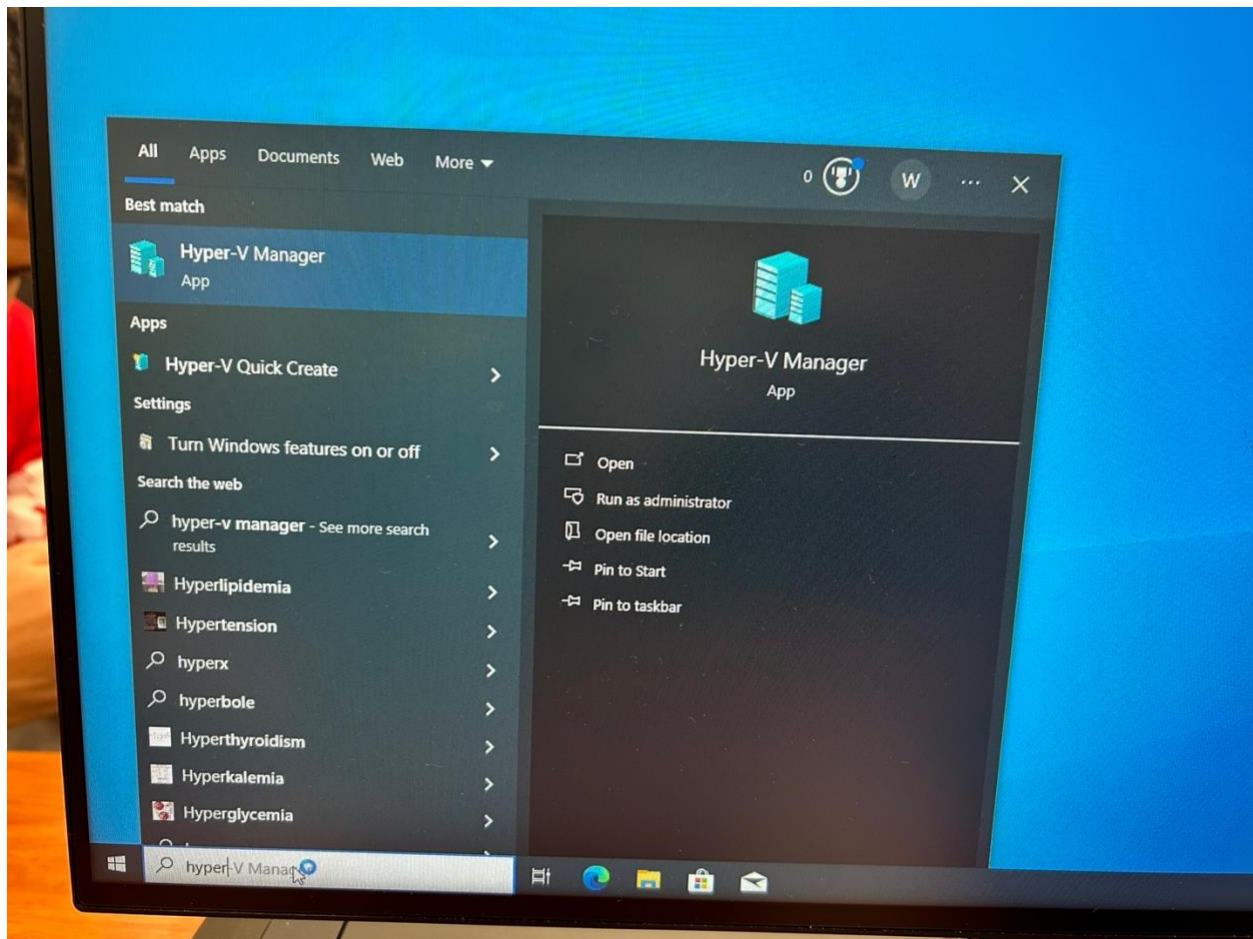

Prepare hardware for virtualization services so that the user can create virtual machines. Search for “features” in the Windows search bar. Turn on “Hyper-V”, “Virtual Machine Platform”, “Windows Hypervisor Platform”, “and “Windows Sandbox.” Then select ok.

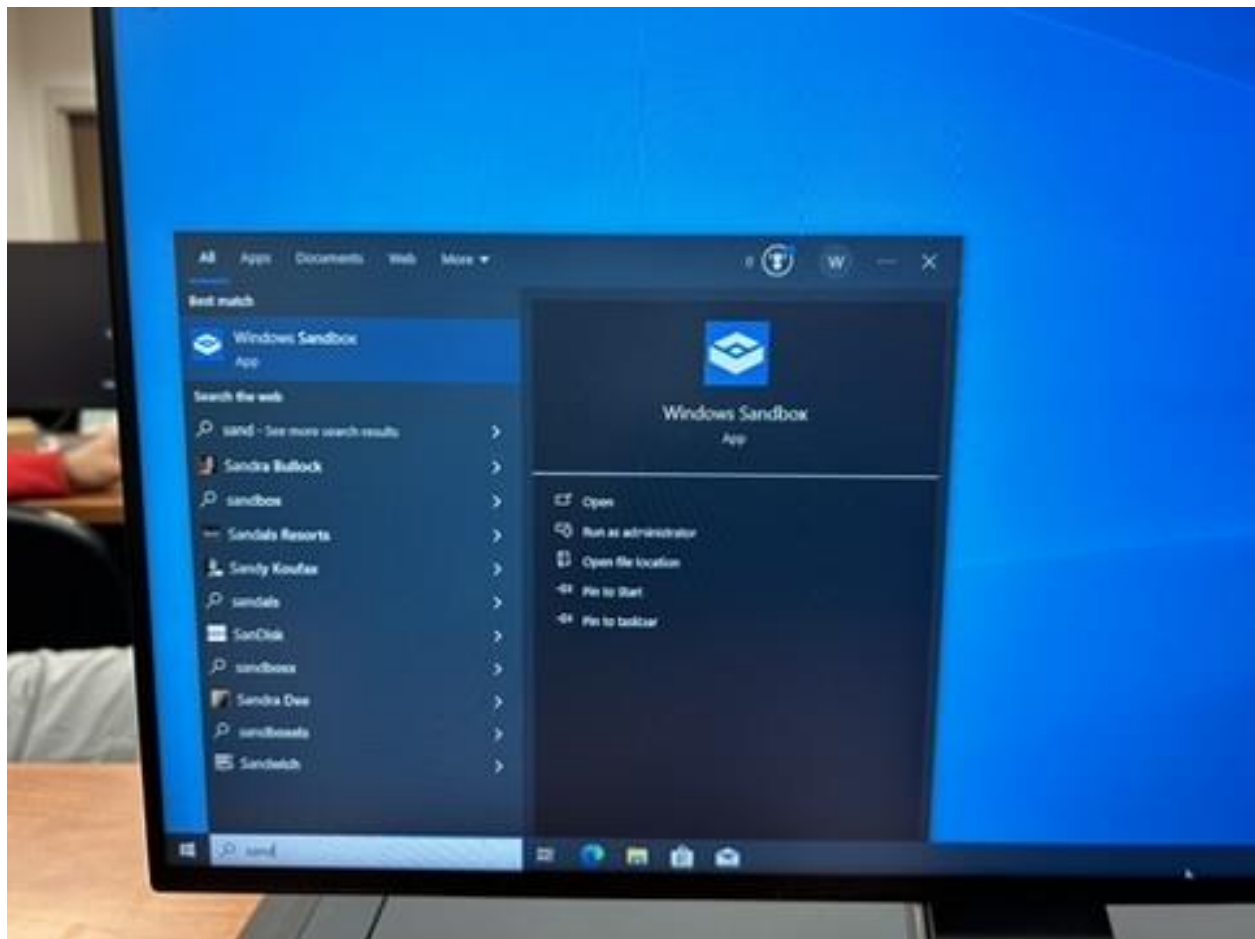

The system will then update for the virtualization tools.

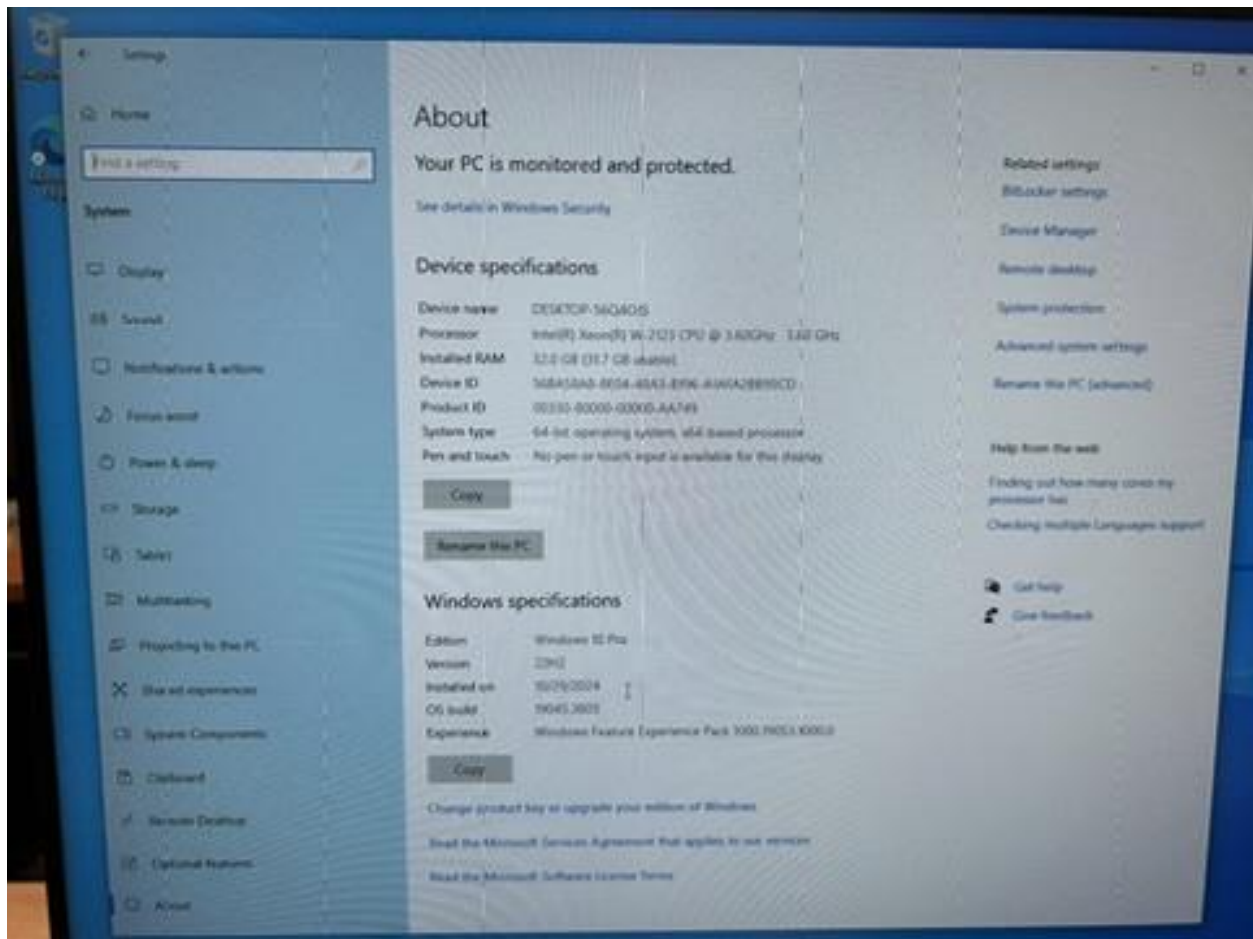

The process is completed.

Ensure the virtualization tools have been installed into the system.
Search for “Hyper-V Manager”

Search for “Windows Sandbox”

Ensure Windows 10 is installed properly with the correct updates.
This completes the final setup process for Windows 10.
